New Data Tool Provides Fast Access to Trade and Investment Stats for Countries

WASHINGTON – The Bureau of Economic Analysis launched today a new data tool on its website that gives users a snapshot of statistics on trade and investment between the United States and another country by simply clicking on a world map.

These fast facts at your fingertips can include:

- Total exports, imports and trade balance between the United States and the country you select.
- The top five categories of goods and services the United States buys from and sells to that country.
- Country level data on U.S. direct investment abroad and foreign direct investment in the United States and on the activities of multinational enterprises such as employment and sales.

The country snapshots, or factsheets, also contain charts and can be printed or downloaded to a spreadsheet. The new data tool pulls statistics from BEA’s international data sets on exports, imports, direct investment, and the activities of multinational enterprises into a single easy-to-digest resource. Similar to the BEA’s BEARFACTS regional factsheets for state and regional economic data, the new international factsheets can be used to quickly get up to speed for a business presentation, a news story, or a school research project.

Users select a country from an interactive world map or a searchable menu of countries. The tool generates a country factsheet with graphs and tables showing the latest data on U.S. trade and investment with that country. A PDF of the factsheet is available for easy printing. The tool also provides data tables containing more detailed statistics that can be downloaded in Excel format.

To access the new international data tool, visit http://bea.gov/international/factsheet/.
