BEA 02-08

GROSS DOMESTIC PRODUCT: FOURTH QUARTER 2001 (FINAL)
CORPORATE PROFITS: FOURTH QUARTER 2001

Real gross domestic product -- the output of goods and services produced by labor and property located in the United States -- increased at an annual rate of 1.7 percent in the fourth quarter of 2001, according to revised estimates released by the Bureau of Economic Analysis. In the third quarter, real GDP decreased 1.3 percent.

The GDP estimates released today are based on more complete source data than were available for the preliminary estimates issued last month. In the preliminary estimates, the increase in real GDP was 1.4 percent (see "Revisions" on page 3).

The increase in real GDP in the fourth quarter reflected positive contributions from personal consumption expenditures (PCE) and from government spending that were partly offset by negative contributions from private inventory investment, from nonresidential fixed investment, from exports, and from residential investment. Imports, which are a subtraction in the calculation of GDP, decreased in the fourth quarter.

The upturn in real GDP growth in the fourth quarter reflected accelerations in PCE and in government spending, and a smaller decrease in exports that were partly offset by larger decreases in inventory investment and in nonresidential fixed investment, and a downturn in residential investment. There was also a smaller decrease in imports in the fourth quarter.

NOTE.--Quarterly estimates are expressed at seasonally adjusted annual rates, unless otherwise specified. Quarter-to-quarter dollar changes are differences between these published estimates. Percent changes are calculated from unrounded data and annualized. "Real" estimates are in chained (1996) dollars. Price indexes are chain-type measures.

The price index for gross domestic purchases, which measures prices paid by U.S. residents, increased 0.5 percent in the fourth quarter, 0.1 percentage point more than in the preliminary estimate; this index decreased 0.1 percent in the third quarter. Excluding food and energy prices, the price index for gross domestic purchases increased 2.0 percent in the fourth quarter, compared with an increase of 0.6 percent in the third. The fourth-quarter upturn in the price index also reflected an acceleration in PCE services prices associated with the treatment of insurance payments resulting from the September 11th terrorist attacks. The increase in benefit payments is treated as a third-quarter reduction in the average net premiums paid for insurance services. Excluding the insurance-related price effects, the gross domestic purchases price index decreased 0.2 percent in the fourth quarter, following an increase of 0.6 percent in the third.

Real personal consumption expenditures increased 6.1 percent in the fourth quarter, compared with an increase of 1.0 percent in the third. Real nonresidential fixed investment decreased 13.8 percent, compared with a decrease of 8.5 percent. Nonresidential structures decreased 33.6 percent, compared with a decrease of 7.5 percent. Equipment and software decreased 5.3 percent, compared with a decrease of 8.8 percent. Real residential fixed investment decreased 4.6 percent, in contrast to an increase of 2.4 percent.

Real exports of goods and services decreased 10.9 percent in the fourth quarter, compared with a decrease of 18.8 percent in the third. Real imports of goods and services decreased 7.5 percent, compared with a decrease of 13.0 percent.

Real federal government consumption expenditures and gross investment increased 11.4 percent in the fourth quarter, compared with an increase of 3.6 percent in the third. National defense increased 9.0 percent, compared with an increase of 3.2 percent. Nondefense increased 16.0 percent, compared with an increase of 4.2 percent. Real state and local government consumption expenditures and gross investment increased 9.6 percent, in contrast to a decrease of 1.3 percent.

The real change in private inventories subtracted 2.16 percentage points from the fourth-quarter change in real GDP, after subtracting 0.81 percentage point from the third-quarter change. Private businesses reduced inventories \$119.3 billion in the fourth quarter, following decreases of \$61.9 billion in the third quarter and \$38.3 billion in the second.

Real final sales of domestic product -- GDP less change in private inventories -- increased 3.8 percent in the fourth quarter, in contrast to a decrease of 0.5 percent in the third.

Gross domestic purchases

Real gross domestic purchases -- purchases by U.S. residents of goods and services wherever produced -- increased 1.7 percent in the fourth quarter, in contrast to a decrease of 1.0 percent in the third.

Gross national product

Real gross national product -- the goods and services produced by the labor and property supplied by U.S. residents -- increased 2.6 percent in the fourth quarter, in contrast to a decrease of 1.3 percent in the third. GNP includes, and GDP excludes, net receipts of income from the rest of the world; in the fourth quarter, receipts decreased \$25.8 billion, and payments decreased \$46.8 billion.

Current-dollar GDP

Current-dollar GDP – the market value of the nation's output of goods and services -- increased 1.5 percent, or \$38.4 billion, in the fourth quarter to a level of \$10,263.3 billion. In the third quarter, current-dollar GDP increased 0.9 percent, or \$22.3 billion.

Revisions

The final estimate of the fourth-quarter increase in real GDP is 0.3 percentage point, or \$5.9 billion, higher than the preliminary estimate issued last month. The upward revision to the percentage change in real GDP primarily reflected an upward revision to exports of services and a downward revision to imports of services.

	<u>Advance</u> (Percent change from preceding quarter)	<u>Preliminary</u>	<u>Final</u>
Real GDP.....	0.2	1.4	1.7
Current-dollar GDP.....	- .1	1.1	1.5
Gross domestic purchases price index.....	.4	.4	.5

Corporate Profits

Profits from current production (corporate profits with inventory valuation and capital consumption adjustments) increased \$125.0 billion in the fourth quarter. In the third quarter, profits decreased \$62.8 billion. Current-production cash flow (net cash flow with inventory valuation and capital consumption adjustments) -- the internal funds available to corporations for investment -- increased \$78.5 billion in the fourth quarter, compared with an increase of \$13.5 billion in the third.

Domestic profits of financial corporations increased \$46.9 billion in the fourth quarter, in contrast to a decrease of \$29.3 billion in the third.

Domestic profits of nonfinancial corporations increased \$57.2 billion in the fourth quarter, in contrast to a decrease of \$35.6 billion in the third. In the fourth quarter, both real gross corporate product and profits per unit of real product increased. The increase in unit profits reflected a larger decrease in the unit costs incurred by corporations than in the prices corporations received; both unit labor and nonlabor costs decreased.

The rest-of-the-world component of profits increased \$20.9 billion in the fourth quarter, compared with an increase of \$2.1 billion in the third. This measure is calculated as (1) receipts by U.S. residents of earnings from their foreign affiliates plus dividends received by U.S. residents from unaffiliated foreign corporations minus (2) payments by U.S. affiliates of earnings to their foreign parents plus dividends paid by U.S. corporations to unaffiliated foreign residents. The fourth-quarter increase was accounted for by a larger decrease in payments than in receipts.

Profits before tax with inventory valuation adjustment is the best available measure of industry profits because estimates of the capital consumption adjustment by industry do not exist. According to this measure, domestic profits of financial corporations increased, and domestic profits of nonfinancial corporations decreased. Profit decreases of nonfinancial corporations were widespread among major industry groups. The largest decreases occurred in manufacturing, in the transportation and public utilities group, and in "other" nonmanufacturing.

Profits before tax decreased \$61.2 billion in the fourth quarter, compared with a decrease of \$57.7 billion in the third. The before-tax measure of profits does not reflect, as does profits from current production, the capital consumption and inventory valuation adjustments. These adjustments convert depreciation of fixed assets and inventory withdrawals reported on an historical-cost basis to the current-cost measures used in the national income and product accounts. In addition, the fourth-quarter change in the capital consumption adjustment reflected the retroactive provisions of the Job Creation and Worker Assistance Act of 2002 as discussed below. As a result, the capital consumption adjustment increased \$172.7 billion in the fourth quarter (from \$13.4 billion to \$186.1 billion), in contrast to a decrease of \$16.9 billion in the third. The inventory valuation adjustment increased \$13.5 billion (from \$3.1 billion to \$16.6 billion), compared with an increase of \$11.9 billion.

Profits tax liability decreased \$10.8 billion in the fourth quarter, compared with a decrease of \$23.1 billion in the third. Profits after tax decreased \$50.4 billion, compared with a decrease of \$34.7 billion. Dividends increased \$8.3 billion, compared with an increase of \$8.1 billion; undistributed profits decreased \$58.7 billion, compared with a decrease of \$42.8 billion.

Retroactive Provisions of the Job Creation and Worker Assistance Act of 2002

The Job Creation and Worker Assistance Act of 2002 was signed into law on March 9, 2002. The act includes certain retroactive provisions related to depreciation and to the carryback period for net operating losses: It allows an immediate write-off of 30 percent on certain investments contracted for after September 10, 2001, and before September 11, 2004; it includes tax benefits retroactive to September 11th for the area of New York City that was damaged in the terrorist attacks; and, for tax year 2002 and retroactively for tax year 2001, it temporarily extends the period for carrying back net operating losses to 5 years from the current 2 years.

The fourth-quarter estimates of corporate profits shown in this release have been adjusted to reflect the retroactive provisions of the act that affected corporate tax liability. These adjustments were incorporated on a "best-change" basis using preliminary estimates provided by the Treasury Department.¹ The adjustments reduced the fourth-quarter change in profits before taxes, which reflects the inventory-accounting and depreciation-accounting practices used for federal income tax returns, by \$146.5 billion and increased the fourth-quarter change in the corporate capital consumption adjustment by the same amount. Profits from current production are not affected, because this series does not depend on the depreciation-accounting practices used for federal income tax returns; rather, it is based on depreciation of fixed assets valued at current cost and using consistent depreciation profiles based on used-asset prices. The adjustments reduced the fourth-quarter change in profits tax liability by \$35.3 billion and reduced the fourth-quarter change in profits after tax by \$111.2 billion.

As with corporate profits from current production, the effects of the retroactive provisions of the act on nonfarm proprietors' income with inventory valuation adjustment (IVA) and capital consumption adjustment (CCAdj) (tables 8 and 9) were offsetting; nonfarm proprietors' income without IVA and CCAdj was reduced and the related CCAdj was increased by the same amounts. The other major national income and product account components or aggregates shown in this release were not affected.

¹Thus, the adjustments reflect the changes from the revised third-quarter levels of a series to the revised fourth-quarter levels. The quarterly levels of these series will be revised to incorporate the effects of the act in the upcoming annual revision of the national income and product accounts (NIPA's), scheduled for release on July 31, 2002. The NIPA personal tax series are recorded on a cash basis; thus, the effects of the act on personal taxes paid by proprietors will be reflected in the estimates for 2002.

Corporate profits in 2001

Profits from current production decreased 12.5 percent in 2001, in contrast to an increase of 6.2 percent in 2000. Domestic profits decreased 16.5 percent, in contrast to an increase of 4.1 percent. The foreign component of profits increased 9.1 percent, compared with an increase of 19.4 percent.

Profits before tax decreased 17.4 percent in 2001, in contrast to an increase of 8.9 percent in 2000. The before-tax measure of profits does not reflect, as does profits from current production, the capital consumption and inventory valuation adjustments. The smaller decrease in 2001 profits from current production, compared with the decrease in profits before tax, resulted from increases in the inventory valuation adjustment and in the capital consumption adjustment.

Profits tax liability decreased 20.4 percent in 2001, in contrast to an increase of 7.3 percent in 2000. Profits after tax decreased 15.9 percent, in contrast to an increase of 9.7 percent. Dividends increased 9.8 percent, compared with an increase of 10.5 percent; undistributed profits decreased 66.1 percent, in contrast to an increase of 8.1 percent.

^r revised

NOTE.—Users are cautioned that particularly for components for which relative prices are changing rapidly, the use of chained-dollar estimates to calculate component shares or component contributions to real growth may be misleading even just a few years from the base year. For accurate estimates of the contributions to percent changes in real GDP, use table 2.

See "Explanatory Note" at the end of the tables.

^r revised.

1. For some components of final sales of computers, includes computer parts.
2. Farm output less intermediate goods and services purchased.
3. Consists of GDP less gross product of farm, of housing, of households and institutions, and of general government.

See "Explanatory Note" at the end of the tables.

Explanatory Note: Measures of Output and Prices

This note describes the calculation of chain-type quantity and price indexes used in the NIPA's.

Changes in current-dollar GDP measure changes in the market value of goods, services, and structures produced in the economy in a particular period. These changes can be decomposed into quantity and price components. Quantities, or "real" measures, and prices are expressed as index numbers with the reference year--at present, the year 1996--equal to 100.

The annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent years. (Quarterly changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent quarters; quarterly indexes are adjusted for consistency to the annual indexes before percent changes are calculated.) For example, the 1999-2000 annual percent change in real GDP uses prices for 1999 and 2000 as weights, and the 1999-2000 annual percent change in GDP prices uses quantities for 1999 and 2000 as weights. These annual changes are "chained" (multiplied) together to form time series of quantity and price indexes. The Fisher formula also produces percent changes in quantities and prices that are not affected by the choice of reference years. In addition, because the changes in quantities and prices calculated in this way are symmetric, in general, the product of a quantity index and the corresponding price index equals the current-dollar index. (BEA also publishes a measure of the price level known as the "implicit price deflator (IPD)," which is calculated as the ratio of current-dollar value to the corresponding chained-dollar value, multiplied by 100. The values of the IPD are very close to the values of the corresponding "chain-type" price index for all periods.)

Chain-type quantity and price indexes for GDP and its major components are presented in this release as index numbers in table 5 and in the form of percentage changes from the preceding period in tables 1, 4, 6A, and 6B. Contributions by major components to changes in real GDP are presented in table 2. BEA also prepares measures of real GDP and its components in a dollar-denominated form, designated "chained (1996) dollar estimates." For GDP and most other series, these estimates, which are presented in table 3, are computed by multiplying the 1996 current-dollar value by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 1996 and if real output for this component increased 10 percent in 1997, then the chained (1996) dollar value of this component in 1997 would be \$110 ($\100×1.10).

For analyses of changes over time in an aggregate or in a component, the percentage changes calculated from the chained-dollar estimates and from the chain-type quantity indexes are the same; any differences will be small and due to rounding. However, because the relative prices used as weights for any period other than the reference year differ from those used for the reference year, the chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP or to any intermediate aggregate. A measure of the extent of such differences is provided by a "residual" line, which indicates the difference between GDP (or another major aggregate) and the sum of the most detailed components in the table. For periods close to the reference year, when there usually has not been much change in the relative prices that are used as weights for the chain-type index, the residuals tend to be small, and the chained (1996) dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. As one moves further from the reference year, the residual tends to become larger, and the chained-dollar estimates become less useful for analyses of contributions to growth. Thus, the contributions to percent change shown in table 2 provide a better measure of the composition of GDP growth. In particular, for components for which relative prices are changing rapidly, calculation of contributions using chained-dollar estimates may be misleading even just a few years from the reference year.
