Economic Highlights

Price Control at the Cross Roads

If wholesale prices of all commodities were held firmly at January level for rest of the year, they would nevertheless be at a high level surpassed only by annual averages of 16 previous years since 1800. January farm price level was surpassed by only 4 years in that period and food prices by only 15 years. Various factors prevent perfectly accurate price comparisons over long periods, but those shown in the charts are approximately correct as to the general level of the commodity groups concerned.

The Nation must either stop the price rise at around current levels or brace itself for the painful consequences. It ought not to have to learn the evils of inflation the hard way all over again after having paid for same costly lesson three times since 1800. History of inflation in all countries at all times solidly establishes three clear reasons for avoiding it: First, spiralling prices impose an unnecessary and inequitable burden on majority of consumers; second, they tend to diminish, rather than increase the sup-

plies coming to market; and third, the certain collapse of resulting top-heavy price structure brings disastrous depression. If inflation occurs despite past lessons, it will almost surely give rise to demands for floors under prices in vain efforts to prevent the subsequent inevitable price collapse.

Majority of individuals cannot protect themselves against inroads of inflation on their living costs—especially food—and on their savings. Food prices tend to outrun incomes—in 1920 at peak of war inflation, they were up 111 percent over 1913 compared to 76 percent for per capita nonfarm income—one-fifth more. Inflated prices cut purchasing power of cash savings, while ensuing deflation confiscates sizable portions of most types of invested savings. Against these results of runaway inflation, effective price controls are our chief defense not only during the war but also in immediate postwar period.

The Business Situation

BUSINESS developments during February conformed to the now familiar pattern of continued expansion in the war-goods sphere accompanied by further contraction and restriction of the civilian economy. Industrial production, as measured by the Federal Reserve seasonally adjusted index, apparently advanced 1 point to a new peak of 201. The rise, as in all recent months, was concentrated almost entirely among the durable-goods manufacturing industries. Nondurable-goods production declined while minerals output was higher because of gains among the fuels components.

Manufacturers' shipments continued to be in heavy dollar volume, attaining an annual rate of 135 billion dollars, 12 percent larger than the record value of manufacturing output, 121 billion dollars, attained last year.

Retail trade likewise continued in record dollar volume for this season of the year. The high February level of the series was attributable to an extraordinary buying wave as well as price advances.

As income payments continued to flow in a steadily larger stream the Bureau of Labor Statistics index of 889 wholesale prices responded by advancing 1 point during February despite the large proportion of all products other than farm output which has been brought under effective price control. Further farm product price increases appeared likely as additional attention was given to possible methods of increasing farm production in view of the increasing gravity of the outlook for food supplies. Living costs also advanced fractionally during the month with food prices continuing to lead the way as has been characteristic during recent months.

Rationing began in earnest on March first. Its extension to cover canned, dried, and frozen foods as well as shoes further underlined the magnitude of the disparity which now exists between civilian supplies and civilian purchasing power. With many new rationing programs certain to come in the next few months, the necessary wartime process of reducing and equalizing civilian living standards appeared to be well under way. An indication of the way these living standards may eventually be cut was furnished by the release of estimates of minimum essential civilian requirements prepared by the War Production Board's Civilian Supply Division.

From the record level of 81.5 billion dollars reached in 1941, Civilian Supply estimated that consumer purchases might, if necessary, be cut in real terms to 56 billions (of 1941 dollars) before reaching "bedrock levels" or levels considered indispensable to maintenance of effective military output and activity during a long war.

The details of the so-called "bedrock" estimates of essential civilian requirements are, of course, controversial and subject to necessarily arbitrary definitions of essentiality. The broad picture outlined by the above stated aggregates, however, is of interest as an informed view of the amount of civilian curtailment which is feasible for the duration of the war period.

Manpower Problem More Acute

Other economic developments during February and early March pointed more clearly to manpower as being the single problem into which most others on the domestic front are being increasingly resolved. The term "mobilization," originally a military term applied to the assembling of troops from civilian life for armed service, is nowhere so appropriately used in connection with our economic preparations as when applied to the manpower outlook for 1943 and later. The Nation's need for men and women is, as shown in table 1, great and imperative.

Table 1.—Summary of Labor Force and Armed Force Requirements, December 1942 to December 1943

Requirements	Millions of persons	Supply	Millions of persons
Increase in armed forces.....	4.3	Decrease in less essential civilian employment.....	3.2
Increase in civilian employment:		Reduction in unemployment.....	.5
Munitions.....	1.8	Accessions to labor force required from nonworker groups.....	2.7
Essential nonagricultural....	.3		
Total requirements.....	6.4	Total of above manpower sources.....	6.4

Source: War Manpower Commission.

The 1943 manpower outlook is notable for the number of new workers who will have to be recruited for the civilian labor force and also for the amount of reshuffling of workers within the labor force. It is quite likely that the requirement estimates as shown in the left-hand column of table 1 should be regarded as being at minimum levels. The sources from which may come the required 6,400,000 persons needed during 1943, are suggested in the right-hand column. If they are actually forthcoming from the sources and in the amounts as shown, a tremendous population shuffle is obviously ahead as millions quit jobs to enter the armed forces, as other millions leave nonessential industries to replace them in essential lines, and still other millions leave home and school to bolster the work force.

Since Government policy in this matter has not yet been fully determined, it is clear that the required millions of persons may not be obtained in the amounts

and from the sources as listed. Study of the supply side of table 1 reveals two basic alternatives between which a choice can be made or which can be used in combination. If the requirement estimates be accepted as they stand, these alternatives on the supply side are: Either secure the needed workers by withdrawing them from less essential industries and thus further shrinking civilian supplies, or recruit them from the ranks of the nonworkers, or do both. Another alternative—drawing on the unemployed—finds this source almost at a minimum now.

If it be assumed that during this year manpower requirements and supply are as shown in table 1, then by December the size and distribution of our civilian labor force and armed forces will be as indicated in table 2. A most striking aspect of this distribution is the sharp gain of women workers relative to men in the munitions and "other" industries. Another is the further decline of 1,600,000 in the total civilian labor force.

Table 2.—Estimated Civilian Labor Force and Armed Forces, December 1941-43

According to Census estimates, there appeared to be in November 1942 a volunteer United States labor reserve of 5,000,000 persons 14 years old and older. It was composed of people willing and able to take full-time jobs under certain conditions. The characteristics of this voluntary labor reserve are shown in table 3.

It will be clear from inspection of the table that this volunteer reserve is composed largely of women, most of whom are engaged in home housework. Of these, 83 percent are married and 40 percent are responsible for the care of children—largely children under 10 years of age. These family responsibilities obviously hinder to some extent their freedom of work. In fact, three-fourths of this volunteer reserve are definitely not willing to leave home to work elsewhere. The 5,000,000 volunteers, according to the Census Bureau, are distributed geographically in about the same way the general population is distributed. The 193 war-production centers, including neighboring communities, where labor shortages exist now or are

expected later this year, contained in 1940 approximately one-third the total United States population. Hence, a maximum of only one-third of the volunteer reserve resides in or near war-production centers.

Under these circumstances, it is clear that it will not be an easy task even under the most favorable conditions to recruit the additional 2,700,000 nonworkers required at the minimum for the labor force.

Source: U. S. Department of Commerce.

In acute labor-shortage areas, however, the fact that an adequate number of people may be induced to in-migrate to meet labor needs does not constitute a simple or complete solution to the problem. Inadequate housing and other accommodations in such areas preclude sole reliance upon in-migration. So far as possible, the problem must be solved on an area basis so as to minimize the necessity of expanding housing and other community requirements of an enlarged population. This means that the utmost reliance must be placed upon the present inhabitants of the shortage areas.

Either a large number of persons living in those areas and not now in the labor force must take local jobs, or less essential civilian industries in the shortage areas will have to be heavily curtailed or even closed down entirely to release manpower for local war production. Certainly the production of civilian products of a nonessential character in areas of acute labor shortages must stop—perhaps also the production of essential civilian goods if there are facilities in non-shortage areas where these commodities may be manufactured.

Neither is curtailment a complete solution. The difficulty in recruiting many additional war workers from civilian industries in labor shortage areas lies in the fact that these areas are now meagerly serviced. Indeed some actual expansion of service industries may be necessary if many women are to be induced to leave their homes to enter the labor market. Moreover, the number of workers that would now be released to war industries by closing down nonessential civilian indus-

tries in shortage areas is not believed to be large. Consequently some further in-migration will probably be necessary to augment the best efforts of the present inhabitants.

Another basic but partial solution to the manpower problem is to make more complete utilization of the workers already in the labor force. This can be done by longer hours of work, by reduction of currently serious absenteeism, turn-over, discrimination, labor hoarding and other restrictive practices. The Government has already moved toward a longer work week by Executive Order requiring a minimum of 48 hours in certain designated labor shortage areas.

The actual contribution of the 48-hour week to our manpower supply during 1943 is not as yet clear. Neither is it clear whether the productivity of the new industrial recruits replacing the skilled men inducted into the armed forces is equal to that of those they replaced. If not, current estimates of manpower requirements may prove to be low.

The Outlook for National Product and National Income in 1943

The estimates of national income and national product for 1942, published in a special article in this issue, invite speculation about the probable changes in these measures that will be recorded for 1943. It is well to consider, before citing possible figures for the present year, the peculiar difficulties of forecasting in time of war and the type of assumption these difficulties necessitate. In one sense the forecasting problem is very much simplified. Assuming that the current year will not see the end of the war, we can be sure that there will be no lack of aggregate demand and that every attempt will be made to harness our economic resources for maximum output. We need have no concern, as in times of peace, about the possibility of shrinking investment opportunities or of saturation of consumers' goods markets.

On the other hand, the actual results for 1943 will be determined much more than in times of peace by legislative and administrative decisions yet to be taken. Although one may weigh the possibilities in these matters, it is either impossible or inappropriate to forecast them. Consequently, while such imponderables as the changes in taxes to be enacted or the effectiveness of price control are of vital importance, they must be set aside here. Accordingly, it is assumed for purposes of the forecast that no further price rise will occur from present levels and that present tax legislation will remain unchanged. It is left to the individual reader to modify these assumptions and change the forecast as he sees fit.

The gross national product in 1943, upon the basis of the above assumptions, will be substantially higher than the 1942 total of 152 billion dollars. The probable level for the year is between 175 and 180 billions.

Involved in this figure, of course, is the price rise that has already occurred from the 1942 average through February—approximately 4 percent in terms of the Bureau of Labor Statistics' cost-of-living index.

The gross national product of 1943 will be divided almost entirely between Government expenditures and consumer purchases of goods and services. Government expenditures, State and local as well as Federal, are likely to exceed 100 billion dollars compared with 62 billions in 1942, while consumer expenditures may decline to approximately 77 billions from the almost 82 billions in the previous year. Since nearly nine-tenths of the Government total is accounted for by war expenditures, there is an obvious judgment here that production and manpower difficulties will not prevent attainment of a tremendous war output. Private gross-capital formation should fall to something between zero and 2 billion dollars, since a small volume of construction and equipment expenditures will be offset by a fairly sizable drain on inventories. Gross private capital outlay in the previous year was 8 billion dollars.

The assumption of constant prices from this point forward implies maintenance of present wage rates. Upon this basis, the national income in 1943 will reach the neighborhood of 140 billion dollars in contrast to the 1942 estimate of a little less than 120 billions. An earlier forecast of 135 billions for 1943 was based upon incomplete 1942 data which indicated a national income level for that year of only 117 billions. Income payments to individuals should approximate 135 billion dollars in 1943, likewise about 20 billion dollars higher than in 1942.

Of this tremendous income flow, taxes paid out of individual incomes will require a minimum of 14 billion dollars on the basis of present legislation, including State and local as well as Federal. Hence, if both prices and consumer supplies are held so that consumer outlays for available goods and services are limited to about 77 billion dollars, savings of individuals will soar well above 40 billion dollars. Whatever adjustments in the above forecasts might be made, therefore, it is clear that severe intensification of the threat of inflation during 1943 is in prospect.

Value of Manufacturers' Output, 1942

New evidence of the tremendous power of American industry to produce when confronted with a high level of effective demand for its products is offered by the increase in the value of manufacturers' output during 1942. Reports to the Commerce Department's monthly Industry Survey indicate that the gross value of products manufactured in the United States soared to a new peak of 121 billion dollars for the year as a whole. This compares with the previous record total of 94 billion dollars in 1941 and is more than double the 57 billions reported by the Census of Manufactures in 1939.

Value of products represents selling value at the plant or factory. Because the products of some establishments are used as materials by others, the gross value of products includes a considerable amount of duplication, estimated roughly at one-third of the total. Higher prices are, of course, reflected in factory selling values and are partly responsible for the rising trend in the value of manufactured products since 1939. It is estimated that nearly one-half of the 30-percent increase in value of products from 1941 to 1942 is accounted for by the rise of 10 percent in the average wholesale price of industrial products.

Rubber products	.9	1.0	1.4	1.5
Other nondurables ²	8.4	8.9	11.0	13.8

¹ Includes lumber, furniture, stone, clay, and glass products, nonferrous metals, and miscellaneous durable goods industries.

² Includes tobacco, apparel, leather, and miscellaneous nondurable goods industries.

Source: U. S. Department of Commerce.

The shift in the character of manufacturing output brought on by wartime expansion is indicated by the data shown in table 4. Thus production of the durable-goods industries, which constituted only 44 percent of

total value of products in 1939, made up 52 percent of output in 1941 and 54 percent in 1942. There was, however, a marked contrast between the composition of durable-goods output in each of these latter 2 years. In 1941 a record-breaking output of consumer durable goods was superimposed upon the production of a heavy volume of construction materials and the beginning of the armament program. In 1942 the decline in output of consumer durables was more than offset by the increase in production of munitions and of materials for peak level construction activity.

In 1942 war materials accounted for approximately one-half of the estimated 80 billion dollars net value of manufacturing output after adjustment for duplications. This figure includes not only the value of finished armaments but also equipment and materials for new plants, other construction materials, and all other products used in converting the economy to a full wartime basis during the year.

Business Inventories

Liquidation of civilian inventories during recent months has ended the general inventory expansion that previously featured the wartime rise in business activity. Record-breaking consumer purchases reduced the aggregate value of stocks held by manufacturers, wholesalers, and retailers from an all-time peak of 29.3 billion dollars on June 30, 1942, to 28.3 billions by the end of December. A drain on stocks through wholesale and retail channels more than offset a continued moderate rise in manufacturers' inventories to produce this net decline of a billion dollars in the aggregate. Replacement of trade inventories has been hampered by growing military and Lend-Lease requirements and by the dwindling production of civilian goods.

Reductions in the closing months of 1942 did not, however, entirely wipe out the increase in inventory values built up during the first half of the year. As a result, the total value of business inventories at the end of 1942 exceeded that of the beginning of the year by 1.25 billion dollars—a moderate rise compared with the increase of 6 billions during 1941. Adjustment for the fact that present stocks are carried at higher prices than those of last year indicate that the physical volume of inventories is now somewhat below its level of one year ago.

Table 5.—Value of Business Inventories, End of Month

[Millions of dollars]

Year and month	Total	Manu- facturers	Whole- salers	Retailers
1941:				
December	27,081	15,747	4,697	6,637
1942:				
March	28,450	16,464	4,899	7,087
June	29,311	17,183	4,632	7,496
September	29,034	17,439	4,245	7,350
December	28,345	17,653	3,992	6,700

Source: U. S. Department of Commerce.

Manufacturers' Inventories Higher.

Manufacturers' stocks were the only types of business inventories to rise significantly in 1942. For the year as a whole, the increase amounted to 1.9 billion dollars—85 percent of which was concentrated in the war-stimulated durable-goods industries. Even for manufacturers, however, the rate of increase showed a pronounced drop in the final half of the year when additions to inventories amounted to less than \$500,000,000 for the entire 6-month period. This compares with 1.5 billion dollars in the first half of the year and with 2.5 billions during the last half of 1941.

Growing shortages of basic supplies are, of course, the principal reason for the slower rate of inventory expansion. Enormously stepped-up production requirements have made the accumulation of protective inventory cushions in excess of requirements more and more difficult. The steady shift of economic resources—labor, plant, equipment, and power to armament production—has been more to end products than to raw materials. This has not resulted in surplus raw mate-

Chart 2.—Relationship between Inventories and Shipments of Durable-Goods Manufacturing Industries

Source: U. S. Department of Commerce.

rials stocks but rather has added to demands for materials because of generally expanding activity. Thus, while stocks have continued to increase in substantial volume in the durable-goods industries, output expansion has led to urgent demands both for more materials and for better scheduling of the existing flow of supplies.

Inventories have been increasingly drawn down in those industries in which civilians have a relatively larger stake, i. e., most nondurable goods plus such civilian durables as furniture, lumber, stone, clay, and glass products (see table 6). These industries in par-

ticular have felt the pressure of huge civilian-purchasing power combined with large military and Lend-Lease demands. Stocks of finished goods held by these manufacturers have suffered heavy depletion, especially in the final quarter of 1942. By the end of December, for example, finished lumber stocks had been reduced to approximately one-half of their value at the beginning of the year. The corresponding reduction in the value of finished textile mill products exceeded 25 percent. In addition, finished goods held by manufacturers of food products, leather goods, stone, clay and glass products, and furniture were all below first-of-year values.

Table 6.—Percentage Changes in Value of Manufacturers' Inventories, End of 1942 from End of 1941

Industry group	Percent change	Industry group	Percent change
Total manufacturing	+12	Nondurable goods	+4
Durable goods	+19	Chemicals and allied products	+11
Transportation equipment (except automobiles)	+48	Paper and allied products	+6

Other machinery	+22	Petroleum refining	-10
Nonferrous metals	+7	Leather and leather products	-14
Stone, clay, glass products	-3		
Furniture	-9		
Lumber	-12		

Source: U. S. Department of Commerce.

Allowances for higher prices indicate that the declines in terms of physical quantities were, of course, larger than those registered by value figures. Finally, replacement of supplies as well as expansion of capacities in most of these industries is difficult and, in some cases, impossible because of the manpower, materials, and equipment shortages generated by the war program.

Charts 1, 2, and 3 show the effect of the inventory developments just outlined on the general relationship of stocks to sales. They point to the fact that the slower rise in durable-goods inventories and the recent decline in nondurable-goods inventories have combined with the continued advance in shipments to pull inventories back toward their more usual relationship with production requirements. The charts show the rise in inventories that has accompanied the expansion (traced by the movement of the points from left to right) of shipments since 1939.

The dotted line on chart 1 represents the average relationship of inventories to shipments based on the 2½-year period from 1939 through the second quarter of 1941. Deviations from this relationship were small during the base period—the expansion of inventories being generally in proportion to the expansion of shipments. In contrast, inventories increased phenomenally in relation to shipments during the latter half of 1941 and the first half of 1942. Protective buying replaced immediate production needs as a motive for much of the inventory accumulation during this second period,

and stocks expanded far out of line with the indicated requirements of production. This movement has now been reversed. The important fact today is that shipments, especially of war materials, have expanded to a point where the level of inventories is now nearer to the amount needed to sustain the enlarged volume of output. Similar conclusions can be drawn from the charts for both durable and nondurable goods.

Chart 3.—Relationship between Inventories and Shipments of Nondurable-Goods Manufacturing Industries

Source: U. S. Department of Commerce.

This new phase naturally brings its own problems. In the field of arms production it necessitates the use of closer and closer tolerances in the scheduling of materials. In the field of civilian supply it increasingly emphasizes the need for a fair and equitable distribution of scarce goods. But all of these are symptomatic of the facts that surplus inventories are being gradually whittled down and that resources are being increasingly put to more effective uses as the war effort approaches its peak.

Trade Inventories Declining.

Inventories held by wholesalers and retailers have declined in recent months as extremely heavy consumer purchases have been met by a diminished flow of civilian supplies. Wholesale stocks, currently valued at less than 4 billion dollars, are lower than at any time in almost 2 years. They have fallen from a wartime high of 4.9 billion dollars early last year in a downward movement which began in durable goods lines but which has gradually spread to practically all civilian-goods dealers in the wholesale field.

Retail inventories have also been reduced. Heavy liquidation in the closing months of 1942 practically wiped out the huge increases in retail stocks that occurred during the first half of the year. In that earlier

period output of civilian goods was still large enough both to expand inventories and to enable producers to meet the rising tide of demand. As a result the value of retail holdings hit an all-time peak of 7.5 billion dollars at the end of June. By the end of December, however, they were down to 6.7 billions—little changed from their value at the beginning of 1942.

As could be expected, trade outlets specializing in irreplaceable consumers' durable-goods have experienced the heaviest reductions in inventories. This can readily be seen from the year-to-year percentage changes in stocks by kind of business, as reported to the Census Bureau. Figures released by the Census are shown in table 7 for selected kinds of wholesale and retail business. In both fields the largest declines have been in durable-goods outlets such as hardware, lumber and building materials, furniture, household appliances, and the like.

Table 7.—Percentage Changes in Value of Selected Trade Inventories, End of 1942 From End of 1941

Kind of business	Percent change	Kind of business	Percent change

Source: U. S. Department of Commerce.

Larger stores were able to maintain a more favorable inventory position throughout 1942 than were the smaller stores. Census returns for independent retailers show that large stores, i. e., those with annual sales in excess of 200,000 dollars, increased the value of their inventories by 4 percent during the year. All other size brackets show a drop over the period with the largest decrease (6 percent) occurring in the smallest size bracket, i. e., stores with annual sales under 10,000 dollars. In general, larger stores show either larger increases or more moderate declines than do smaller stores.

Retail Trade

Retail sales, which were well maintained in January, moved forward in February to a record level for this time of year. The shoe rationing order touched off a buying wave in apparel which lifted the seasonally adjusted Department store sales index (1923-25=100) to 165 in February, compared with 143 in January. Men's clothing sales were probably not much above the high level of the preceding year, but sales of women's clothing showed a large increase over 1942. Furniture sales were well maintained, but hardware stores during

recent months have been reporting substantial declines over comparable months of the previous year. Losses in dollar volume are also increasing at filling stations and at building materials dealers.

Table 8.—Sales of Retail Stores, by Kinds of Business, 1941-43

[Millions of dollars]

Kind of business	Year			Percent change, 1942 to 1943

¹ Due to rounding, group figures do not necessarily add to totals for all retail stores.
² Forecast based on quantities of goods to be available for civilians in 1943 according to present programs, and on price increases from 1942 which are moderate except in the case of food.

Source: U. S. Department of Commerce.

Revised figures now available for 1942 show total retail sales at 56.4 billion dollars, an increase of 4 percent from 1941. After allowing for price rises, retail sales in constant dollars declined 8 percent. This figure, however, does not reflect the full extent of the decline in physical volume of retail trade. Data both on production for civilian use and on inventory changes, although not complete, show a considerably larger decline in units sold, indicating that trading up or quality deterioration or both occurred on a substantial scale during the past year.

In 1943, production for civilian use is being further restricted by the requirements of the war program. If prices can be held reasonably well in check a decline in total retail sales seems inevitable. The effect of curtailments will, of course, be much greater in some lines than in others. Based on information now available, table 8 indicates roughly the relative cuts to be expected in each major retail group. Present indications are that building materials and hardware dealers will be hardest hit, followed by household furnishings stores, automotive stores, and filling stations. Eating

and drinking places, on the other hand, are expected to have increased sales.

Retail Sales Tax a Possible Revenue Measure.

The question of a retail-sales tax has been brought to the fore again following the Presidential request for 16 billion dollars of additional current revenue. Such a tax, if enacted, would undoubtedly be applied not only to sales of retail stores as here defined, but also to sales not for resale made by wholesalers, manufacturers, farmers, etc. On the other hand, service receipts and certain other items which are included in sales of retail stores would probably not be taxed. The estimates of a retail-sales tax base calculated on this basis are shown in table 9. They indicate that a 5-percent tax would yield somewhere in the neighborhood of 2.5 billion dollars in fiscal year 1944 if no exemptions were allowed for commodities already taxed by the Federal Government.

National Income and National Product In 1942

By Milton Gilbert and George Jaszi

The significant developments in the national income and national product from 1941 to 1942 all stem from the mobilization of the economy for war. Broadly speaking, three trends stand out: First, an expansion of the flow of total output and a concurrent fuller utilization of the factors of production; second, an added rise of dollar values due to pervasive inflationary pressure; third, a radical shift in the composition of the national product and in the industrial distribution of the income flow.

Changes within the year 1942 were especially pronounced. The economic situation was so dynamic that the end-of-the-year position of the national product and most of its components was far different from that at the beginning of the year. Whereas before Pearl Harbor the rearmament effort was still small enough to leave the civilian economy essentially undisturbed, by the end of 1942 most of the path to full economic mobilization had already been traveled. For this reason, estimates for the year as a whole have to be supplemented by quarterly data to present an adequate picture of the economic situation in 1942.

Expansion of the Gross National Product.

Owing primarily to the insatiable demand for war matériel, the sharply upward trend of the gross national product in the past few years was continued throughout 1942. This aggregate, composed of the value of the currently produced commodities and services flowing to government, to business for gross capital purposes, and to consumers, reached the record total of 151.6 billion dollars last year, rising from 119.2 billion dollars in 1941. The phenomenal advance under the rearmament program in 1941, when the gross product increased 22 billion dollars, was surpassed both in absolute and percentage terms by the rise in 1942 under the stimulus of war. Within the year the trend was exceedingly steep, gross national product rising from an annual rate of 128.8 billion dollars in the last quarter of 1941 to 168.8 billions in the corresponding quarter a year later, as can be seen from chart 1. The resurgence of American productive power from the time of the outbreak of the European war in September 1939 to the end of 1942 is reflected in a more than 90 percent increase in the value of the gross national product over that period.

This precipitous rise in the value of gross output resulted not only from a steadily increasing flow of the quantity of goods and services but, as is well recognized, from a continuously rising trend of prices. Accurate

removal of the inflationary influence during a period covering the transition from peace to war is exceedingly difficult for both conceptual and statistical reasons. The very concept of the physical quantity of output becomes highly tenuous when the assumption of constant wants is inapplicable and when the free market is displaced by price control and rationing. Furthermore, price data are not available for the entire range of output; they are likely to reflect quality change inadequately; and they certainly do not reflect the intangibles such as limited range of choice, simplification of style, and reduction of complementary services. Specifically, lack of data has necessitated the assumption of constant average munitions prices, and though this assumption is supported by existing evidence, it will no doubt be altered to some extent in the light of further information on the subject. Despite these difficulties an approximate adjustment for the price rise is furnished here because even a rough notion of the change in real output considerably increases the usefulness of the estimates.

Chart 1.—Utilization of Gross National Product (Seasonally Adjusted Annual Rates)

Source: U. S. Department of Commerce.

According to these data shown in table 1, the gross national product in terms of constant prices has risen substantially during the past few years. In 1942 there occurred an increase of 19 percent, in contrast to the advance in the current value of the gross product of 27 percent. Over the entire period from 1939 to 1942 the gross product in constant prices rose by 50 percent as against a current value rise of over 70 percent.

Table 1.—Gross National Product in Current and 1939 Dollars, 1939-42

Year	Gross national product		Implicit price index
	Current dollars	1939 dollars	
1939	88.6	88.6	100
1940	97.0	96.2	101
1941	119.2	112.3	106
1942	151.6	133.2	114

The extent of the expansion of the gross national product in terms of constant prices has been so spectacular and so far beyond what most analysts thought possible that a question is raised as to the adequacy of the method of deflation used. It may be noted, however, that actual man-hours worked in civilian nonagricultural pursuits appear to have increased by more than 30 percent between 1939 and 1942, that the volume of agricultural production rose by 20 percent over the same period, and that the armed forces expanded greatly and accounted for a significant part of the gross product in 1942. Moreover, it appears certain that the economies of scale, the increase of efficiency due to reduced number of models and styles, and particularly the increase in output of munitions per man-hour have much more than offset any decrease in average skill that may have occurred because of the rapid enlargement of the labor force. If, in addition, consideration is given to the fact that a shift of the factors of production from industries of lower to higher value of output per worker is taken as an increase in real output in the conventional methods of price deflation, it does not seem that the estimated increase of the gross product in constant prices is unreasonable.

As implied previously, one may, of course, question the entire theoretical meaning of a measure of real output under the conditions prevailing over this period. That is another question, however, and one which, incidentally, does not deny the appropriateness of the usual techniques of price adjustment for problems of price stabilization and fiscal policy.

Government War Expenditures.

Since the past year was one of economic mobilization for war, the changes in the components of the gross national product were dominated by the increase in government expenditures for war purposes. (As explained more fully in the notes to the tables, the war expenditures referred to here represent only those which constitute a utilization of current output and not the total of war outlays as shown in accounting statements of the Treasury.) The 1942 war expenditures were 49.1 billion dollars compared with 12.5 billions a year earlier and only 1.4 billions in 1939. During the space of our first year at war, from the fourth quarter of 1941 to the same quarter of last year, Government war expenditures rose from an annual rate of 18.8 billion dollars to 70.1 billions. This rate

of increase is so spectacular as to make comment unnecessary. Since the President's full-war budget for the fiscal year 1944 contemplates war expenditures of 100 billions it may be seen how far along the way to complete economic mobilization the Nation was by the end of 1942. Of course, there have been inevitable delays in gearing the economy for a task of this magnitude. Furthermore, not all the goals of the program were completely fulfilled—which might have been expected with huge objectives decided upon long before experience had been gained on which to judge their feasibility. Despite these shortcomings, however, it is evident that during our first year of war a stupendous job of mobilizing the economy was performed, one which is a tribute to the bold planning of government, to the initiative and resourcefulness of industry, and to the discipline and skill of labor.

With war expenditures rising so much more rapidly than gross output, the war effort has taken a larger proportion of the gross national product month after month. By the last quarter of 1942, 42 percent of our gross output was accounted for by war expenditures whereas in the same period of 1941 this figure was only 15 percent. For 1942 as a whole, war expenditures constituted 32 percent of the gross product as against 10 percent in 1941 and 2 percent in 1939.

Year and quarter	Gross national product (billions of dollars)	War expenditures (billions of dollars)	War expenditures as percent of gross product
1939	88.6	1.4	2
1940	97.0	2.7	3
1941	119.2	12.5	10
I	109.4	7.6	7
II	116.0	10.0	9
III	122.6	13.6	11
IV	128.8	18.8	15
1942	151.6	49.1	32
I	134.3	27.7	21
II	145.8	41.5	28
III	137.5	37.1	26
IV	168.8	70.1	42

In presenting these percentages of gross national product devoted to war, reference to their limited significance should be repeated.¹ The definition of war expenditures, it has been pointed out, is arbitrary and does not attempt to separate goods essential to the prosecution of the war from those that are not. For instance, military use of consumption goods is considered part of war expenditures while consumption by workers in armament plants is not. Again, a capital asset purchased by private industry is not included in war output even though it may be devoted entirely to the production of armaments, whereas a government purchase of the identical equipment for identical purposes is included in war expenditures. Therefore, the more nearly the peak of the war effort is approached and the more nearly all lines of expenditure not con-

¹Cf. *Survey of Current Business*, August 1942.

tributing to the war effort are eliminated, the more the distinction between war and nonwar expenditures loses significance.

Furthermore, if one is interested in the distinction between production that ministers to the usual needs of a peaceful population and production that is adapted only to war needs, the comparison of war expenditures with total national product may also be misleading. In the case of durable capital goods, for example, the resources engaged in their production are currently not available for satisfying consumer wants. Once embodied in capital goods, the extent to which these resources will be devoted to the satisfaction of consumer wants will depend not so much on whether the capital goods have been produced for war purposes or not, as on their durability and convertibility. It is clear that an analysis along these lines would cut across the present classification of war and nonwar expenditures.

Another reason for caution in the use of these ratios is that they reflect the use of output rather than its production. Inventory changes of both war goods in process and nonwar goods can be quite large and move in opposite directions. These possibilities should be kept in mind when using the ratios as indicators of the current allocation of productive effort.

Finally, the magnitude of war expenditures should not be taken as a measure of the amount of civilian goods which the same factors of production would be capable of producing in the absence of the war effort. There are indications that the remuneration of resources engaged in the production of war goods is substantially higher than the remuneration of identical factors producing civilian goods.

For these reasons, the percentage of war expenditures to national product should not be regarded as more than an approximate index of the magnitude and progress of the war-production effort.

Other Components of Gross National Product.

While there was considerable divergence in the movement of other components of the gross national product, as a whole they fell below the 1941 level in 1942. Nonwar expenditures of Government participated in this decline.

Federal nonwar expenditures have declined continuously since 1939, with a drop of 18 percent between 1939 and 1942, as may be seen in chart 2. This overall decline hides widely divergent movements in the components. On the one hand, Government expenditures related to the Social Security program increased, reflecting mainly the growth in Social Security grants to States for special types of public assistance. Interest payments also increased sharply, due to the growth of the national debt. On the other hand there have been declines in aids to agriculture, expenditures on public works and on work relief, including the Civilian

Conservation Corps, that more than counterbalance the increases.

Chart 2.—Percentage Change in Federal Nonwar Budget Expenditures by Major Types, Calendar Year 1942 from 1939¹

¹ The width of each bar represents the percent that each major type is of the total nonwar budget expenditures for 1939.

² Includes United States contribution to Government-employees' retirement funds.

Source: U. S. Treasury Department.

Owing to inadequacy of information, the movement and composition of state and local expenditures are more difficult to trace. Indications are that these expenditures decreased because of a decline in relief expenditures and in state and local construction.

Private Gross Capital Expenditures.

The most substantial reductions among the major components of the gross national product were in the area of private gross capital outlay, the record total of 19.0 billion dollars for 1941 falling to 8.0 billions in 1942. The decline in this outlay during 1942 was so precipitous that by the final quarter of the year the annual rate was only 1.3 billion dollars. The ease of converting capital goods industries to war production, and the possibility of drawing upon both inventories and the foreign balance account for the severe decline of this segment of the gross product. As may be seen in chart 3, private construction and private purchases of machinery and equipment fell drastically in 1942 under the impact of material shortages and conversion of these industries to war production. By the fourth quarter of 1942 private construction and purchases of durable equipment were about one-third of the last quarter of 1941. The high rate of inventory accumulation which reached its peak in the fourth quarter of 1941 but continued throughout the first half of 1942 was replaced by a sizable drain on accumulated stocks in the last half of 1942.

Concurrent with the decline in private gross-capital formation there occurred a substantial increase in

charges to depreciation and depletion accounts, reflecting mainly the special amortization provisions that are allowed on the construction of emergency facilities under the Second Revenue Act of 1940, and increased depletion charges owing to a record output in the extractive industries. A comparison of the figures of private gross-capital formation with the measure of depreciation and depletion might suggest that by the second half of 1942 the United States had begun to consume its total stock of fixed capital. Such a conclusion, however, is unwarranted. In the first place, depreciation and depletion estimates are in terms of accounting dollars and intended to approximate the actual charges made in business records rather than the amount of capital consumption. There is reason to believe that, particularly for recent periods, they overstate the current consumption of capital.

Chart 3.—Private Gross Capital Formation (Seasonally Adjusted Annual Rates)

Source: U. S. Department of Commerce.

Secondly, and quantitatively more important, expenditures for capital facilities by the Government have been unusually large. According to best indications, nearly one-half of the total output of producers' durable equipment was purchased by the Government in 1942. Thus, in spite of the sharp decline in private purchases, total production fell only slightly below the all-time records established in 1941. As chart 4 shows, Government accounted for the bulk of the construction of industrial facilities in 1942. In spite of the decline in private construction, the total in 1942 was nearly double that of 1941 and far exceeded any previous level.

This Government construction and equipment is not necessarily lost permanently to the civilian sector of the economy. For, although there can be no doubt that some of the structures and equipment are too specialized to be subsequently useful to the civilian economy, this is probably not true of the bulk of Government industrial facilities. Just as a significant part of private capital equipment proved to be readily convertible to war production in 1941-42, it may be anticipated that the Government capital facilities will be convertible to

civilian use after the war. It does not follow that because it might not have been profitable for private industry to finance these facilities, their operation at their cost to industry after the war will not be profitable. Thus, in spite of the fact that the private stock of fixed capital might well decline in the course of the war, it would not be surprising if, after the difficulties of transition are overcome, the Nation had a better capital

Chart 4.—Value of New Industrial Construction

Source: U. S. Department of Commerce.

plant after the war than at the beginning of the rearmament program.

Consumers' Expenditures.

Of the nonwar components of the gross national product only consumers' expenditures increased in 1942. The 1942 total is estimated at 81.9 billion dollars—an all-time high for the dollar value of goods and services passing into the hands of consumers, compared with the 1941 figure of 74.6 billion dollars. It may be noted that consumers' purchases of durable goods declined fairly sharply but the rise in nondurable goods and services was large enough to send the total to the new high level. In further contrast to other types of nonwar expenditures, consumers' purchases remained extraordinarily high throughout the year with even the fourth-quarter level exceeding that of the previous year by a substantial margin.

When the dollar value of consumers' expenditures is adjusted for rising prices, consumers' goods and services in 1942 seem to have fallen slightly below the 1941 volume. As shown in table 2, consumers' expenditures in 1942 were 69.7 billion dollars in terms of 1939 prices as compared with 70.0 billions in 1941. Even if one makes all the allowance that may appear reasonable for the possibility that price quotations somewhat understate the rise in prices, it is evident from these data that the consumer was affected by warrestrictions to only a minor degree in 1942. Consumers' expenditures on automobiles and parts dropped to insignificance, and the quantity of motor fuel and household goods fell substantially. All other major groups of

consumers' goods and services, however, equaled or exceeded their 1941 level.

Services.....	22.7	23.8	25.0	26.2

¹ Detail will not necessarily add to totals because of rounding.

In appraising the position of the consumer during this first year of war, certain aspects of the concept of consumers' expenditures used here should be noted. In the first place, it does not include consumption goods purchased by the Government for the use of our armed forces. Hence, it represents only purchases made directly by the consumer rather than the total of consumption goods flowing to our population. If account were taken of the consumption by the armed forces, provided by Government, the total of goods received by individuals in 1942 would more than equal the volume in 1941. In the matter of food and clothing there is no doubt that the population as a whole was better off in 1942 than at any time in the Nation's history, both in total and on a per capita basis.

In the second place, consumers' expenditures measure the goods passing into the hands of the consumer in the current year—a concept employed because of its usefulness in market analysis and similar problems. From the standpoint of the consumers' welfare, however, it is more appropriate to measure the services received in the current year whether from new purchases or from the consumers' existing stock of goods. This is particularly important in the case of durable goods, where the stock is large relative to each year's purchases so that a large decline in current acquisition has only little influence on current services received. In table 3 are

Table 3.—Consumer Expenditures and Current Consumption, 1940-42¹

1942.....	64.5	5.2	5.9	69.7	70.4

¹ Detail will not necessarily add to totals because of rounding.

² Current services from stock of durable goods represent depreciation of stocks in hands of consumers, with the following exceptions: Expenditures for books and other durable printed matter and for monuments and tombstones are charged to the period in which they are purchased; value of consumption of passenger cars in the last three quarters of 1942 extrapolated from 1941 by gasoline consumption.

shown estimates of consumers' goods and services for both these concepts.

It may be noted that the services available to consumers from the stock of consumers' durables declined only negligibly in 1942. This decline is due entirely to our counting the services rendered by passenger cars in 1942 on the basis of gasoline consumption. Total commodities and services available to consumers on the basis of this "welfare" concept was significantly higher in 1942 than in 1941. There is, of course, no intention in these calculations of glossing over the insoluble problem of defining economic welfare under the conditions of the past few years. They are designed only to stress the fact that the requirements of war in 1942 barely touched the consumer standard of living in a quantitative sense.²

How did it prove possible to maintain so high a volume of consumption in 1942 in the face of the huge war-production program that was carried out simultaneously? Four factors in the 1942 situation, some of which will be materially altered in 1943, answer this question: (1) In the existing phase of the war effort when mobilization on the production front was dominant, only that part of the consumers' goods output which could be converted to munitions production was seriously affected. Of course, there were delays in securing even this conversion, but these delays were less important in maintaining the total flow of consumers' goods than the fact that only a relatively small segment of consumers' goods industries could be converted—namely, those producing durable goods. (2) The flow of goods to consumers in 1942 was maintained, to some extent, out of previously accumulated inventories. Inventory statistics are not available on consumers' goods alone, but the existing data indicate that consumers' expenditures to the extent of 2.5 billions may have come out of inventories in the course of the year. (3) In maintaining the total flow of consumers' goods and services, one of the most important factors was the existence of sufficient manpower up until the very end of the year to enable those industries not affected by military requirements to meet the rising demands of consumers with increased output. (4) It is also important, in contrast to what the situation will be this year, that in 1942 the demands of the armed forces and Lend-Lease for consumption commodities remained relatively small.

That we got both guns and butter in 1942, therefore, is an indication of the prior under-utilization of our economic resources and not a sign of failure in our war-production effort. It is important to recognize that by the time the fourth quarter of 1942 was reached the relatively high flow of goods to consumers was not in itself imposing restrictions on the output of war materials. Continued criticism of either business or

² It may be mentioned, on the other hand, that, inasmuch as the concept of consumers' expenditures embraces only goods ordinarily associated with the market economy, it does not reflect the loss of the services of housewives involved in the increased employment of women in industry.

the war-production authorities on this score is quite groundless. Materials and facilities readily convertible to munitions production were no longer being used to produce consumers' goods above the almost irreducible minimum and the flow of such goods to consumers was coming almost entirely out of irreplaceable business inventories. This does not mean that substantial curtailment of consumption is not in prospect in 1943. Such curtailment will result, however, from increased consumption goods and manpower requirements on the military front and from the manpower requirements of the munitions facilities constantly coming into production.

The Real Source of War Output.

One may summarize the changes in the gross national product during 1942 by reference to chart 5 which shows the real sources from which war production in 1942 was derived relative to the situation a year earlier. It may be noted that the increase in war expenditures at constant prices over this period amounted to 32.7 billion dollars. Of this increase 20.9 billions, or two-

Chart 5.—Real Sources of Increase in War Expenditures, 1942 from 1941, in 1939 Dollars ¹

¹ Due to an error the increase in gross national product in the chart is overstated by 0.7 billion dollars and the decrease in private gross capital formation is understated by the same amount.

Source: U. S. Department of Commerce.

thirds, was derived from the expansion of total output while 11.8 billions, or one-third, was secured through the conversion of output from nonwar to war purposes.

While all types of nonwar output participated in this conversion, the bulk of the transfer was in the area of private-capital formation. The adaptability of the capital goods industries to war production and the availability of large inventories at the beginning of the year explain this situation. It is not, of course, a situation peculiar to the United States. All belligerent countries are foregoing private capital replacement and expansion and drawing heavily upon accumulated stocks of goods. What is peculiar to this country as compared with the other major belligerents, is the

moderate decline thus far in consumers' goods. Comparative lack of manpower stringency and relatively smaller import requirements explain this favorable situation.

National Income.

The changes in the gross national product that have been reviewed naturally involve equally marked changes in the national income generated in the course of this production. These changes resulted not only in a record total but also in shifts in the relative importance of the income shares as well as the industrial source of the income.

In 1942, the national income, representing the sum of the earnings of the labor and capital resources employed in the productive process, reached the unprecedented total of 119.8 billion dollars. This exceeded the previous all-time high of the preceding year by 25 percent and the 1939 total of 70.8 billions by 69 percent. The 1929 aggregate of 83.3 billions, the peacetime peak, was less than 70 percent of the 1942 national income.

While income originating in each industry group increased in absolute terms between 1941 and 1942, the largest relative increases occurred in those industry groups that have felt the direct impact of wartime demands. The importance of each industry in the income total for recent years is set forth in table 4. Especially noteworthy are the relative increases in agriculture, manufactures, and contract construction initiated in 1941 and continued in the succeeding year. Thus, the income derived from agriculture accounted for 9.2 percent of the total in 1942 compared with 7.7

Table 4.—Percent Distribution of National Income by Industrial Divisions, 1939-42

¹ Includes work-relief wages shown separately in table 15; excludes subsistence to members of the armed forces.

in the preceding year and 7.4 in 1939. The share of manufacturing in the total increased from 24 percent in 1939 to 28.9 and 30.6 in 1941 and 1942, respectively, while in contract construction the comparable figures are 2.7, 2.7, and 4.1 percent.

Within the manufactures group, however, the shifts were far from uniform. Indeed, the single large gain was in the metals and metal products industries which constituted 16.6 percent of the national total in 1942 but only 8.9 percent in 1939. The chemical products and petroleum refining group was up slightly from 1939 and construction materials and furniture had the same relative position, though both of these groups declined between 1941 and 1942. All the other subgroups of manufactures declined in relative importance between 1939 and 1942. This is only another way of emphasizing the extent to which the expansion of output associated with the war has been a durable-goods expansion.

Other relative declines occurred, not unexpectedly, in the distribution and service industries, more notably in finance and services proper. In the mining industries the share of the total was comparatively stable while the income attributable to governmental services, including the armed forces, was 13.7 percent of the national aggregate in 1942 compared with 12.0 in 1941 and 14.1 in 1939. The relative decline from the pre-war level is explained by the sharp curtailment in work relief. It is somewhat surprising that in the face of the increase in the armed forces and in Government arsenals and navy yards, income originating in Government was a smaller proportion of national income in 1942 than in 1939.

Changes in Distributive Shares.

The changes in types of income have been equally striking. The largest percentage increase between 1941 and 1942 accrued to farm proprietors. Their net income in the latter year is estimated at 9.7 billion dollars, a gain of 55.5 percent over their net income of 1941 and a more-than-doubling of that of 1939. This is the first year since the post-war inflation of 1919 that the net income of farm operators has exceeded 9 billion dollars.

Although farm production increased almost 13 percent between 1941 and 1942, the 28.7 percent increase in prices received by farmers was the much more important factor accounting for the very sharp gain in net income of farm operators. On the other hand, total production expenses rose only by 18 percent. Income from marketings of every commodity increased at least 20 percent; the largest increases were in the returns from oil-bearing crops, meat animals, vegetables, poultry and eggs.³

The expansion in the net income of other proprietors, largely restricted to the distributive trades and services, was much smaller. Their estimated net income of 10.4

billion dollars in 1942 was 12.0 percent above the preceding year's total. The relatively moderate rise in 1942 is explained largely by the shortage of durable consumers' goods which severely limited or lowered

Chart 6.—Percentage Change in National Income by Distributive Shares, 1942 from 1941

¹ Corporate taxes are not a part of the national income.

Source: U. S. Department of Commerce.

the earnings of the distributors of these goods. The 1942 aggregate, however, was some 50 percent higher than the 1939 total of 6.9 billion dollars.

Wages and Salaries.

There was also a marked expansion in the total salary and wage component of the national income. These payments amounted to 80.3 billion dollars in 1942, a gain of 32 percent over the 60.9 billions paid out in 1941 and an increase of more than 80 percent over the 1939 total. These salary and wage totals include the pay of the armed forces. Since for many problems it is essential to consider only the earnings of the factors of production originating in private business, wages and salaries in Government and private enterprise are shown separately in table 15. Wage and salary payments made by privately owned enterprises increased by 27 percent between 1941 and 1942. This sizable increase followed a nearly equal gain of over 25 percent from 1940 to 1941.

Wage and salary totals increased during the first year of war in every minor industry group, although the increase was less than 2 percent in the production of crude oil and natural gas and in the production and distribution of electric light and power and of manufactured gas. Indeed, larger-than-average increases occurred only in contract construction and in the manufacture of chemicals and allied products, iron and steel products, electrical and other machinery, transportation equipment, automobiles, and nonferrous metal products.

³ The figures on production and prices received by farmers adapted from *The Farm Income Situation*, January 1943, p. 10, Bureau of Agricultural Economics, U. S. Department of Agriculture.

The phenomenal increase in the wage and salary total since 1939, even for private industry alone, is the result of many factors which are difficult to disentangle statistically. The rise in the number employed and the lengthening of the average work week have, of course, been basic factors. From 1939 to 1942 the number of employees in private nonagricultural industry rose by 23 percent while, inclusive of government, the number of wage and salary workers increased almost 37 percent. The average hours worked per week in manufacturing industries increased from 37.7 to 42.9 hours over the same period. While the work week has no doubt risen less for private industry as a whole, increased hours per man has nonetheless been an important factor in expanding the total wage bill.

Another significant factor has been the relative shift in the composition of the working force in private industry toward the higher paid industries. For example, workers in construction and durable manufactures constituted 22 percent of private nonagricultural employees in 1939 and 31 percent in 1942. The influence of this shift on total wages and salaries is augmented by the fact that the work week has risen more in these same higher-paid industries and by the fact that the occupational shifts within industries have also been from lower to higher paid jobs. In addition, there has occurred a large rise in basic wage rates that has been

of considerable importance in increasing the total wage bill as well as an increase in the total amount paid in premium-rate overtime work. The data on average hourly earnings reflect not only both these factors but also shifts in occupational classifications. The increase they show is so large, however, as to leave no question of sizable wage-rate increases. In durable manufactures, for example, average hourly earnings advanced from 69.8 in 1939 to 94.7 cents in 1942, while in non-durables the corresponding figures were 58.2 and 72.3.

The influence of these factors upon average annual earnings per employee is shown in table 5. In almost all industries the increase between 1939 and 1942 was very large, the average for all nonagricultural private industry having been 37 percent. The few instances of relatively small increases reflect mainly the little change in the length of the average work week in those industries. In the case of the Federal Government, the decline in average annual salary wage was due to the increase of the armed forces at rates of cash pay considerably below the average for government.

Corporate Profits.

The data on corporate profits for 1942 are still very incomplete so soon after the end of the year so that only approximate estimates of corporate income can be made at this time. When the bulk of corporation reports for 1942 have been issued, a more complete analysis of last year's profits will appear in the *Survey of Current Business*. With the data now available it appears that corporate profits after taxes were approximately the same in 1942 as in 1941 when the total was 7,668 million dollars. This level represents a rise of more than 80 percent from 1939. A moderate decline in the profits of manufacturing industries was offset by the quite sizable increase in the earnings of transportation companies. Changes among the other industries, while often sizable percentage-wise, did not bulk large in absolute terms. The failure of profits after taxes to rise with the substantial increase in output during 1942 was due, of course, primarily to the substantial increase in income and excess profits tax liabilities. While data on profits before taxes are also very incomplete at this time, present indications are that they rose from 14.6 billion dollars in 1941 to 19.7 billions in 1942.

That part of corporate profit disbursed to individuals in the form of dividend payments is not subject to the same limitations of statistical data. These payments are estimated at almost 4.0 billion dollars in 1942, or 10 percent below the 1941 total and only 4 percent above the 1939 level. Of course, the stabilization of dividends over the business cycle is a corporate policy of long standing. However, the increased needs of business for working capital and a policy of building up reserves for post-war adjustments and conversions were probably additional factors in the moder-

¹ Excludes subsistence to members of the armed forces and work-relief wages.

ate rise of dividends since 1939. This small increase in dividends as against the substantial rise of net profits has raised corporate savings to a relatively large figure.

Other types of return to capital are in the form of interest payments and rents and royalties. The former payments, very stable in recent years, are estimated at 5.4 billion dollars in 1942, an increase of 2.4 percent over the preceding year and only a 5.8-percent gain over the 1939 total. The rise in interest payments made by the Federal Government more than offset the decline by private enterprises resulting from refunding operations. Rents and royalties, on the other hand, increased by 16 percent between 1941 and 1942 and 34 percent between 1939 and 1942.

With the drastic increase in income and excess profits tax liabilities of corporations in recent years, it is necessary to point out that the distributive shares excluding this item no longer adequately reveal what is generally called the factor costs of current output. For the study of either total or percentage composition of factor costs, therefore, one should use corporate profits before taxes on income rather than net profit after taxes. Moreover, as mentioned earlier, income originating in government should be eliminated in assessing the relative changes among the factor costs of private enterprise output. The data in the tables are given in sufficient detail to allow statistical adjustment to concepts appropriate for problems of this sort.

Rise of Individual Savings.

The combination of a substantial increase in the flow of income and a moderate increase in the dollar expenditures of consumers produced a spectacular rise in individual savings in 1942. As may be seen in table 12, income payments to individuals rose from 92.2 billion dollars in 1941 to 115.5 billions in 1942. Since there was only a relatively small increase in the absolute amount of tax payments out of individual incomes, the sum left to consumers for spending and saving was also materially enlarged. Inasmuch as supplies of goods were being restricted and prices were being controlled, the major part of this increase in disposable income of individuals took the form of increased savings. Savings of individuals rose from 13.7 billion dollars in 1941 to 26.9 billions in 1942; by the fourth quarter of that year the annual rate of savings was 35.2 billion dollars.⁴

This vast growth of individual savings has sometimes been interpreted as minimizing the inflationary danger and as diminishing the need for anti-inflationary policies. No interpretation could be more unfortunate than this.

⁴ Attention should be called to the direct estimates of saving published quarterly by the Securities and Exchange Commission. They contain valuable material on the detailed components of saving. Considering the completely different and independent approaches used, the Commerce and SEC estimates agree surprisingly well. After allowing for conceptual differences, the SEC estimates are slightly less than the Commerce figures of 7.5 and 13.7 billion for 1940 and 1941, but almost 3 billion dollars higher than the Commerce figure of 26.9 billion for 1942.

In the first place, it is not sufficiently realized that the savings figure which is reflected in the statistics is the actual amount which individuals have saved during a given period, rather than the amount they intended to save. This distinction is of crucial importance.

Chart 7.—Disposition of Income Payments to Individuals (Seasonally Adjusted Annual Rates)¹

Source: U. S. Department of Commerce.

In periods of rising prices and incomes, individuals with incomes that are not contractually fixed find at the end of each period that their actual income has exceeded their expected income and that they have done some unintended saving because their consumption during the period was based on an expected income that was lower than the actual income they earned.

The savings figure which is registered by the statistics includes, therefore, an unknown amount of unintentional saving which is merely due to the fact that an inflationary process was in progress that raised incomes above their expected levels. Should the inflationary process stop, the savings of the next period would, in the absence of direct controls, fall below the levels attained during the period of inflation. In analyzing the inflationary gap, therefore, it is inappropriate to rely upon the current volume of saving as an offset against inflation.

Another part of saving is contingent upon the further intensification of anti-inflationary policies. A part of increased savings in 1942 no doubt reflects the excess of individual income-tax accruals for 1942 over collections of these taxes. Under present income-tax laws the income-tax liabilities of a given calendar year are collected during the next year so that in years of rising incomes and increasing tax rates there is a substantial excess of income-tax liabilities over collections. It is not known to what precise extent individuals set aside tax reserves on an accrual basis. But, with the increase of income-tax liabilities due only to the increase of rates imposed by the Revenue Act of 1942 amounting to at least 3 billion dollars, it is reasonable to suppose that some provision for payment was being made.

Continuance of such saving is contingent upon further increases in tax rates.

The case of reductions of consumer debt that were the result of restrictions on instalment buying is similar. Retirement of consumer debt—exclusive of lines such as automobiles and other durable goods in which mere nonavailability of goods led to a reduction—was quite large in 1942. The maintenance of such savings, too, is contingent upon the further intensification rather than the mere continuation of the anti-inflationary policies that gave rise to them.

Above all, it must be recognized that a substantial part of the increased savings in no sense represented a really voluntary allocation of income by the consumer. It arose, rather, because the imposition of price control and rationing effectively restricted the amount which the consumer was required to spend for the goods available. Since supplies of nondurables are becoming generally restricted, and since all experience points to the fact that, in the absence of controls, saving is a function of nondurable consumption in real terms rather than in money terms, the maintenance of this type of saving becomes increasingly dependent upon the continuation of successful and comprehensive price control and rationing. The point is merely that one does not save easily when his basic appetites are less than normally satisfied. A high level of consumers' savings relative to income should thus be seen as a consequence of anti-inflationary policies rather than as a factor allowing a relaxation of those policies.

Monetary Sources of War Finance.

Although Federal Government revenues rose substantially in 1942, they were so far outpaced by expenditures that the largest deficit in our history was recorded. The monetary sources from which this deficit was directly or indirectly financed are shown in table 6. In 1941 the total savings absorbed by the Federal Government was still less than the net savings of individuals alone. In 1942, however, individuals' savings were insufficient to meet the Government's requirements so that other components of the gross-savings flow were drawn upon.

The decrease in private-capital outlays was, of course, the main factor in increasing the gross flow of non-individual savings available to government. In addition, however, gross corporate savings, State and local government surplus, and social insurance reserves all increased. It must not be assumed that the increase in the gross-savings flow constitutes a non-inflationary source of financing the deficit. As mentioned in connection with individuals' savings, the increase in the gross-savings flow itself reflects in part the inflationary movement in progress.

Notes to Tables

The following notes to the gross national product and expenditure tables represent partly a consolidation of those accompanying the articles appearing in the *Survey of Current Business*, May and August 1942. They also cover the revisions that have been made in the various series, as well as the new statistical material that has been added. It should be emphasized that the estimates as a whole are preliminary since not all the components have as yet been calculated in a definitive manner. They are designed to show the changes being wrought by the war, not the precise level of each component. Moreover, in order to issue them early enough to be of use in the analysis of current problems, the estimates must be prepared before complete source material on the most recent years becomes available. Revisions for these years are, therefore, inevitable. Finally, in estimates embracing the entire economy and prepared almost entirely from existing statistical data collected for other purposes, it is to be expected that the primary statistical sources for estimating some of the details are far from adequate.

TABLE 1

War Expenditures.—Deflated by a price index prepared by the Munitions Branch of the Division of Research, War Production Board. The index was obtained by deflating a detailed break-down of war output, including munitions and non-munitions, by appropriate wholesale-price indexes. It was assumed that price changes within the category of munitions were self-cancelling and the index for munitions was accordingly held constant at 100. (While this assumption was supported by best available evidence, it is subject to revision in the light of further work on the subject.)

Federal Nonwar Expenditures.—Components of non-war expenditures not deflated include pay rolls, work-relief wages, interest, and agricultural benefits. Nonwar construction was deflated by an appropriate construction-cost index and the remainder by the Bureau of Labor Statistics' wholesale price index of commodities other than farm products and foods. The book-value change in the inventories of the Commodity Credit Corporation was deflated by dividing by a price index constructed from the relation of book value to value in 1939 prices of most of the commodities held by the Corporation.

State and Local Expenditures.—Interest and pay roll components were not deflated. Construction and the remainder were deflated in the same way as were the corresponding components of Federal nonwar expenditures.

¹ Detail will not necessarily add to totals because of rounding.

Private Construction.—Major components of private construction were deflated separately by appropriate construction-cost indexes.

Producers' Durable Equipment.—Deflated by an index of capital equipment, processed, compiled by the National Bureau of Economic Research.

Net Change in Business Inventories.—Business inventories are deflated as one step in obtaining the value of the physical quantity change in terms of current prices.

Net Exports of Goods and Services.—Not deflated.

Net Exports and Monetary Use of Gold and Silver.—Not deflated.

Consumers' Goods and Services.—Price indexes were computed for the eight commodity groups shown in table 2 and each group deflated separately. Services were deflated by the service breakdown of the cost-of-living index of the Bureau of Labor Statistics. Examination of the weights of the component price series of this index indicates reasonable agreement with relative expenditures on corresponding groups of services in 1939.

¹ All rents and royalties are included in the "security brokerage and real estate" industry. For the estimates of rents and royalties see table 15.

² Includes work relief wages shown separately in table 15; excludes subsistence to members of the armed forces.

TABLE 10

Line 1.—Figure for year 1939: Table 13, line 8; other figures: Line 2 plus line 7.
 Line 2.—Line 3 plus line 6.
 Line 3.—Line 4 plus line 5.
 Line 4.—Table A, line 14.
 Line 5.—Table A, line 22.
 Line 6.—Table A, line 25.
 Line 7.—Line 8 plus line 16.
 Line 8.—Line 9 plus 12 plus 13 plus 14 plus 15.
 Line 9.—Line 10 plus line 11.
 Line 10.—Cf. *Survey of Current Business*, May and August 1942, and current issues.
 Line 11.—Same source; includes construction by public-service enterprises.
 Line 12.—Annual estimates published in *Survey of Current Business*, April 1942, revised. Adjustments were made to eliminate government purchases for 1940, 1941, and 1942. For prior years the amount of government purchases included in the commodity flow is relatively small. Quarterly data were obtained by interpolating the annual data by relevant series on shipments, sales, etc., of groups of producers' durable equipment.
 Line 13.—Accounting figures for inventories, except farm inventories, from *Statistics of Income* were supplemented with estimates of inventories held by noncorporate enterprise. Deflated by price indexes representing the lower of cost or market. Changes in the deflated series were multiplied by annual average price indexes to obtain the current value of the physical change. Farm inventories are from the Bureau of Agricultural Economics and also represent changes in physical quantities at current prices. The annual estimates (except farm) were distributed among the four quarters in proportion to the quarterly change in the total book value of inventories. The quarterly book values were obtained by interpolating annual year-end estimates by estimates of the book value of manufacturing, wholesale, and retail trade inventories prepared in the Current Business Analysis Unit of the Bureau of Foreign and Domestic Commerce.
 Line 14.—1939 and 1940: Estimates of the Department of Commerce interpolated by monthly estimates prepared in the Division of Research and Statistics of the Federal Reserve Board. 1941 and 1942: Federal Reserve Board. Lend-Lease exports excluded throughout.
 Line 15.—Net exports of gold and silver plus changes in the monetary stock of gold and silver. Changes in the monetary stock of silver were estimated by deducting exports of silver from the acquisitions of domestic and foreign silver by mint and assay offices.

Lines 16 to 19.—The method of deriving consumer expenditures has been changed from that described in the *Survey of Current Business*, May and August 1942. Although the bulk of the work of estimating consumer expenditures directly has been completed, the estimates being derived by two methods have not yet been reconciled and are not in final form. Consequently, it was most convenient to obtain the total of consumer expenditures for 1939 as previously by deducting government and gross capital expenditures from gross national product as estimated in table 13. Consumer expenditures thus obtained as a residual lay between the two preliminary estimates obtained by direct methods.

Annual estimates after 1939 and the quarterly estimates, however, were obtained from the 1939 figure by means of the changes shown in "Monthly Estimates of Total Consumers' Expenditures, 1935-42," *Survey of Current Business*, October 1942, after the following conceptual adjustments had been made: (1) Depreciation on owner-occupied houses was deducted, (2) gifts of individuals to nonprofit institutions and a small allowance for consumption expenditure of institutions out of endowment income were added, and (3) personal remittances to foreign countries were added. The break-down of consumers' expenditures for goods was derived by adjusting the estimates for each group obtained by the two direct methods to the totals described above.

TABLE 11

This table presents national income by quarters in the form in which annual data have regularly been published. Quarterly figures were first published and described in the *Survey of Current Business* for June 1942.

27	Food stamps and veterans' bonus	(²)	.1	.1	.1
28	Payments from social insurance funds	.9	1.0	.9	1.0
29	Total transfer payments	2.4	2.6	2.5	2.6

¹ Detail will not necessarily add to totals because of rounding.
² Less than \$50,000,000.

TABLE 13

Line 1.—Table 11, line 1.

Line 2.—Table B, line 21 plus line 42.

Line 3.—Corporate depreciation and depletion charges from *Statistics of Income*, raised to cover unincorporated business. Depreciation of rented residences owned by individuals is based on estimates of Solomon Fabricant published in *Capital Consumption and Adjustment*. Figures on noncorporate agricultural depreciation are from Bureau of Agricultural Economics. Quarterly data were derived by straight-line interpolation. Estimates for recent years, for which *Statistics of Income* are not available, were derived by utilizing information on the trend of mineral production, for depletion, and of nonresidential construction and private purchases of durable producers' goods, for business depreciation. The recent sharp increase in the total reflects mainly the effects of the special amortization provisions of the Second Revenue Act of 1940. Estimates of special amortization are based on statistics of certificates of necessity approved.

Line 4.—Charges to bad debt reserves based on *Statistics of Income*, raised to cover unincorporated business. Quarterly figures obtained by straight-line interpolation. Conceptually this item should include certain other business reserves but estimates of these are not yet available.

Line 5.—Represents the portion of the outlay for producers' durable equipment (cf. table 10, line 12) estimated to have been charged to current expense. Estimates of the percentages of various types of producers' durable equipment charged to current expense were made on the basis of the commodity tabulations of the *Output of Manufactured Commodities* prepared in the National Income Unit. This procedure involves a judgment as to the types of durable equipment that are charged to current expense rather than depreciated in prevailing business practice. These percentages were applied to the estimates of expenditures on corresponding types of producers' durable equipment.

Line 6.—This item represents the difference between changes in the book value of business inventories and the physical-quantity change in those inventories expressed in current prices. Cf. note to line 13, table 10.

Line 7.—This item equals the difference between the estimates of national product derived by adding line 2 to line 6 to national income and those obtained by summing the estimates of consumer expenditures, private gross capital formation, and government expenditures. For the year 1939 as a whole this discrepancy is zero, because for that year total consumer expenditures were obtained as a residual by deducting from national product, as estimated by adding line 2 to line 6 to national income, the sum

² Less than \$50,000,000.

of government expenditures and private gross capital formation. For other periods the discrepancy is due to the fact that the estimates of gross national product obtained from the product side in the manner indicated in the notes to table 10 differ from those obtained by adding line 2 to line 6 to national income.

Line 8.—Sum of line 1 through line 7.

TABLES A AND B

The main function of tables A and B is to show the relation between the various government series entering the gross national product tables and published statistics on government finance.

The general manner of deriving government expenditures on goods and services is to eliminate from total government expenditures all those that either do not enter the income account of the next recipient or represent transfer payments and hence are not included in national income. It may be noted that subsidies are not deducted from government expenditures and are, therefore, implicitly counted as a purchase of current output. This procedure is not considered the most preferable conceptually, and is adopted mainly because of lack of data.

For purposes of use in the gross national product tables a break-down of government receipts into business taxes and non-taxes, personal taxes and non-taxes, and contributions to social insurance funds is found most convenient. Personal taxes and non-tax payments include all taxes and non-tax payments to government, exclusive of employment taxes, that are paid out of individual incomes. Business taxes and non-tax liabilities include corporation income and profits taxes and all tax and non-tax liabilities to government that appear as business expense. Table B indicates the items included in these categories. Business taxes and non-taxes enter into the calculation of business incomes on a liability basis. They must, therefore, be added on a liability basis to the sum of factor incomes to obtain a sum that equals the value of the product at market price.

TABLE A

Lines 1 to 10.—*Treasury Bulletin* classification.

Line 11.—Line 9.

Line 12.—*Treasury Bulletin*. Sources and Uses of Funds of Certain Government Corporations and Agencies. War Corporations: Expenses, purchase and improvement of property owned, interest and dividends paid, and other expenditures minus sale of other property acquired, interest, dividends, assessments, and other property income, and other receipts.

Line 13.—These adjustments include net prepayments and purchases of existing assets (mainly purchases of land), that do not constitute purchases of current output, and certain offshore expenditures that do not find reflection in the balance of payments on current account. Also includes Government contribution to allowances for soldiers' dependents and several minor items not constituting expenditures on goods and services.

Line 14.—Line 11 plus line 12 minus line 13.

Line 15.—Line 8.

Line 16.—*Daily Treasury Statement* and *U. S. Budget*. Includes loan transactions, and subscriptions to and repayments of capital in general expenditures and revolving funds. Purchases of land estimated from *U. S. Budget*.

Line 17.—*Daily Treasury Statement*.

Line 18.—Social Security Board and Veterans' Administration. Relief includes estimated Federal share of special types of public assistance and subsistence payments certified by the Farm Security Administration.

Line 19.—*Daily Treasury Statement*.

Line 20.—*Daily Treasury Statement*.—Fiscal year figures equally distributed over quarters.

Line 21.—*Treasury Bulletin*. Sources and Uses of Funds of Certain Government Corporations and Agencies. Reconstruction Finance Corporation group (including Reconstruction Finance Corporation, Disaster Loan Corporation, Federal National Mortgage Association, and RFC Mortgage Company): Expenses, interest and dividends paid, and other expenditures minus interest, dividends, assessments, and property income, and other receipts. Commodity Credit Corporation: Same items plus purchase and improvements of property and loans minus sale of other property acquired and repayment of loans. Inclusion of latter items for the Commodity Credit Corporation is due to the fact that property transactions refer to items that are part of current production and that loans by the Commodity Credit Corporation are part of agricultural income.

Line 22.—Lines 15 minus 16 minus 17 minus 18 minus 19, plus 20 plus 21.

Line 23.—Line 24 plus line 25.

Line 24.—Social Security Board. General relief and estimated State and local share of special types of public assistance.

Line 25.—The basic information was obtained mainly from the publications of the Bureau of the Census, Division of State and Local Governments. The statistics cover fiscal years ended in a given calendar year. It was assumed that all fiscal years end on June 30. This assumption is satisfactory for school districts, but not for other units. To derive figures that were comparable for the various years, to eliminate duplication between State and local governments, and to eliminate expenditures that do not constitute expenditures on goods and services, numerous modifications had to be made in the published figures of State-cost payments, 1939-41. These included adjustments for local shares of State-collected taxes, grants, relief, pensions, State contributions to pension funds, unemployment compensation benefits, and increases in unemployment compensation reserves. Adjustments in 1941 differed from adjustments required in previous years owing to changes in the presentation of the basic statistics. Local expenditures in 1941 were adjusted for relief, pensions, and unemployment compensation benefits and increases in reserves to obtain expenditures on goods and services. State plus local expenditures on goods and services in fiscal year 1941 were then broken into four components: Interest, education, construction, and all other, a residual. The same was done for local expenditures separately. The interest components were extrapolated by net debt (*Indebtedness in the U. S., 1929-41*, Bureau of Foreign and Domestic Commerce) and distributed equally among quarters. The education components were extrapolated annually and quarterly by education pay rolls (National Income Unit). Quarterly construction figures were based on estimates of the National Income Unit. The "all other" component for local units was extrapolated annually by pay rolls excluding education. Then (State plus local total expenditures) minus (State plus local construction, education, and interest components) equals (State plus local "all other"). The total "all other" component was put on a quarterly basis by State and local pay rolls, with adjustment of quarterly figures secured from pay roll indexes to fiscal year totals as secured above and adjustment for the break between last and first quarters of adjoining fiscal years. State and local components were extrapolated to date from fiscal year 1941 by the same series.

In each case, expenditures from grants are included in expenditures of the level of government making the grant.

Line 26.—Line 18 plus line 24 plus government contribution to allowance for soldiers' dependents included in line 9.

Line 27.—Agricultural Marketing Administration and *Daily Treasury Statement*. These payments are made from trust funds and do not appear as budget expenditures.

Line 28.—Social Security Board, Railroad Retirement Board, Civil Service Commission, and data of the Department of Commerce. Comprises benefit payments under Social Security Act and Unemployment Compensation Act, the special railroad schemes, and retirement payments to Federal, State and local employees.

Line 29.—Sum of line 26 through line 28.

TABLE B

Lines 1 to 13.—*Daily Treasury Statement* and *Reports on Collections of Internal Revenue*.

Line 14.—Line 11.

Line 15.—Line 8.

Line 16.—*Daily Treasury Statement*, *Treasury Bulletin*, and *U. S. Budget*. Includes return of surplus funds of Government corporations, seignorage, and proceeds of sales of securities owned by Government.

Line 17.—Corporation income and excess profits taxes: Excess of liabilities as given in *Statistics of Income*, and as estimated from data on corporate profits for 1942 over current collections of these taxes. Capital-stock tax, fiscal year collections allocated to previous calendar year. Excise, stamp taxes, and customs: Collections lagged 1 month. Tax on the use of motor vehicles and boats: Fiscal year collections of the portion of this tax estimated to be paid by business are evenly allocated among the quarters of the fiscal year.

Line 18.—Line 14 minus line 15 minus line 16 plus line 17.

Line 19.—Line 2 plus portion of line 17 representing excess of corporation income and excess profits tax liabilities over collections.

Line 20.—Line 5 plus line 6 exclusive of portion of tax on use of motor vehicles and boats estimated to be paid by individuals plus line 9 plus portion of line 10 estimated to be paid by business plus portion of line 17 representing the excess of liabilities over collections of these taxes.

Line 21.—Line 19 plus line 20.

Line 22.—Line 1 plus line 4 plus portion of tax on use of motor vehicles and boats estimated to be paid by individuals plus portion of line 10 estimated to be paid by individuals.

Line 23.—Line 21 plus line 22 equals line 18.

Lines 24 to 30.—For general source reference and assumption regarding fiscal year endings, see note to line 25 of table A. Calendar-year collections of business taxes for which annual liability and collections coincide were secured by totaling liabilities for the four quarters of the calendar year. Where annual liability and collections do not coincide, the quarterly liability was shifted to obtain taxes on a collection basis. This procedure, although imperfect, gives better results than uniform use of moving averages of fiscal-year collections to obtain calendar-year collections. For methods of deriving quarterly business-tax liabilities and personal-tax collections, cf. notes to lines 40, 41 and 43.

Line 26.—Includes taxes on alcoholic beverages, tobacco, soft drinks, admissions and other commodities.

Line 27.—Line 24 plus line 25 plus line 26.

Line 28.—Includes the group in *State Tax Collections: 1941* plus motor vehicle and hunting and fishing licenses.

Line 32.—Includes poll, severance and documentary and miscellaneous taxes.

Line 34.—Estimates of the National Income Unit made in connection with forthcoming study on housing expenditures.

Line 35.—Other local taxes are the residual between total taxes (1941 figure extrapolated by National Industrial Conference Board estimates of local-tax collections) and property taxes (cf. note to line 34). Local non-tax receipts for years previous to 1941 were estimated with the aid of data for cities over 100,000.

Line 36.—Sum of line 27 through 35.

Line 37.—Line 36.

Line 39.—Line 37 plus line 38.

Line 40.—Estimated calendar-year collections distributed over quarters of previous calendar year according to quarterly corporate profits after taxes.

Line 41.—Includes line 27 plus portion of lines 28, 32, 33, 34 and 35 estimated to be paid by businesses. Wherever possible, fiscal-year collections were put on a quarterly liability basis by using series corresponding to the incurrence of liability. For example, in the case of sales taxes, liability for which is measured by receipts, relevant sales series were used.

Line 42.—Line 40 plus line 41.

Line 43.—Line 29 plus 30 plus portions of 28, 32, 33, 34, and 35 estimated to be paid by individuals. Personal-income taxes and motor-vehicle licenses distributed quarterly on the basis of information contained in *Tax Systems of the World*. For other taxes fiscal-year totals were distributed approximately equally among the four quarters of the fiscal year.

Line 44.—Line 42 plus line 43 equals line 39.

Line 45.—Line 8. Includes old age insurance tax, Federal unemployment insurance tax, Railroad Retirement tax, and the 10 percent of the Railroad Unemployment Insurance contribution which is covered into the Budget of the Federal Government.

Line 46.—Line 48 minus line 45 minus line 47. Includes State unemployment insurance taxes, 90 percent of the Railroad Unemployment Insurance contribution, and employee contributions to Federal, State and local government employee retirement systems.

Line 47.—Includes Federal, State and local government contributions to government employee retirement systems.

Line 48.—Lines 45 through 47. Social Security Board, Railroad Retirement Board, Civil Service Commission, and data of the Department of Commerce. Contributions to social insurance funds are on an accrual rather than a collection basis.

¹ Revised series compiled by the U. S. Department of Commerce, Bureau of Foreign and Domestic Commerce. The revisions were occasioned principally by the adjustment of the monthly data to the Bureau's revised annual estimates of national income for 1939-41 and the preliminary estimate for 1942. There have been no revisions in the data for years prior to 1939 as published in the 1942 Supplement to the Survey. For a description of the data see footnotes 1-12 for p. 6 on p. 177 of that volume. For 1942 figures, see p. 8-1 of this issue.

¹ Data for 1941 and 1942 have been revised by the reporting associations to the 1941 Census of Forest Products; in some cases earlier figures have been also revised on the basis of additional information now available. Stock figures have been revised beginning December 1936 to include for the Southern hardwood region gross stocks (sold and unsold stocks), as for other regions. Figures for all years as shown in the 1942 Supplement include for this region only net, or unsold, stocks. This revision increased the December 1936 figure for hardwood stocks and total stocks 663,000,000 board feet, or 34 and 8 percent respectively. Stocks were further revised beginning December 1938 to include "green" stocks for the Appalachian region which was found to have been reporting "dry" stocks only; the effect of this revision on the comparability of the data is indicated by a comparison of the figures for December 1938 exclusive of the "green" stocks for this region, as given in the table above, with the revised figures in note 4.

² Revisions in addition to those shown above have been made as follows: Total lumber and total softwoods—adjustments have been made in the 1934-37 monthly figures for production and shipments; the monthly averages were not affected by these adjustments. Western pine—new orders, March 1940, 359 million board feet; stocks, December 1941, 1,681. West coast woods—new orders were revised for 1934-37 and adjustments made in the monthly figures for production and shipments for this period. The monthly averages for production and shipments, in most cases, were not affected by the changes in the monthly figures. All revisions are available on request.

³ Figures for years prior to 1937 shown in the 1942 Supplement are not comparable with those shown above (see note 1). December 1936 figures revised to a comparable basis with figures beginning January 1937 above, and to include a minor revision in softwood data, are as follows: Total stocks, 8,620 million board feet; hardwoods, 2,619; softwoods, 6,001.

⁴ Figures shown are comparable with earlier data beginning January 1937. December 1938 figures revised to include "green" stocks for the Appalachian region (see note 1), comparable with data for subsequent years, are as follows: Total stocks, 9,310 million board feet; hardwoods, 2,969; softwoods, 6,341.

Table 3.—INDEXES OF WAGE-EARNER EMPLOYMENT AND OF WEEKLY WAGES IN MANUFACTURING INDUSTRIES, 1941¹

¹ Revised series compiled by the U. S. Department of Labor, Bureau of Labor Statistics. The revisions resulted from adjustment of the industry groups and the totals to final employment data for 1941 and preliminary data for the second quarter of 1942 made available by the Bureau of Employment Security of the Federal Security Agency. Indexes for 1939 and 1940 were not affected by the revisions and are correct as published on pp. 23-24 of the December 1942 Survey. Data for individual industries shown in the December Survey are correct for all years, as no revisions were made in these series.

Monthly Business Statistics

The data here are a continuation of the statistics published in the 1942 Supplement to the SURVEY OF CURRENT BUSINESS. That volume contains monthly data for the years 1938 to 1941, and monthly averages for earlier years back to 1913 insofar as available; it also provides a description of each series and references to sources of monthly figures prior to 1938. Series added or revised since publication of the 1942 Supplement are indicated by an asterisk (*) and a dagger (†), respectively, the accompanying footnote indicating where historical data and a descriptive note may be found. The terms "unadjusted" and "adjusted" used to designate index numbers refer to adjustment of monthly figures for seasonal variation.

Data subsequent to January for selected series will be found in the Weekly Supplement to the Survey.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1943	1942

* Revised.
 † Preliminary.
 ‡ The total includes data for distributive and service industries and government which have been discontinued as separate series to avoid disclosure of military pay rolls.
 § Scattered revisions in figures beginning January 1940 for dairy products, minerals, and fuels, beginning February 1939 for bituminous coal, and in figures for the first half of 1941 for machinery and anthracite, are available on request.
 ¶ New series, see note marked with an "¶" on p. S-2.
 † Revised series. Data on income payments revised beginning January 1939; see p. 27, table 1, of this issue. Earlier data for the revised indexes on a 1935-39 base for cash income from farm marketings will be published in a subsequent issue.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1942

* Revised.

† Preliminary.

New series. The new index of steel production for the combined index for iron and steel as publication of the latter index was suspended after March 1942 until recently. Earlier data are shown in note marked with an "" on p. S-2 of the December 1942 Survey.

§Revisions have been made in seasonal adjustment allowances for recent periods; for total industrial production, total manufactures, durable manufactures, and nondurable manufactures, the resulting changes in the indexes do not exceed 1 point for any month before December 1941. Revisions are available on request.

†Seasonal adjustment factors have been revised to 100 beginning as follows: Furniture, February 1942; polished plate glass, December 1941; bituminous coal, May 1941; anthracite, January 1940; crude petroleum, October 1941. See also note marked "†" on p. S-1 with regard to additional revisions in the fuel series.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1943		1942

* Revised
 † Represents construction from private funds only; data for construction from public funds are included in the total but are not yet available by classes.
 ‡ Data for January, April, July, October, and December 1942 are for 5 weeks; other months, 4 weeks.
 § Data revised beginning January 1940; revisions not shown in the October 1942 issue are available on request.
 ¶ New series. The new estimates of construction activity are compiled by the U. S. Department of Commerce with the exception of the series on residential (nonfarm) construction which is from the U. S. Department of Labor. For a description of the data, see pp. 24-26 of the May 1942 Survey and for January-June 1941 figures, p. 3 of the August 1942 issue; revised quarterly data for 1939 and 1940 will be published later; for 1940-42 annual totals, see p. 11, table 11, of the January 1943 issue. For earlier data for the estimates of total nonfarm dwelling units, see note marked "*" on p. S-4 of the November 1942 Survey; this series includes data for urban dwelling units shown above by months and data for rural nonfarm dwelling units which are compiled only quarterly.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1942

* Revised

* The new series on nonfarm mortgages recorded, compiled by the Federal Home Loan Bank Administration, represents total mortgage registrations during the month, based on reports covering approximately 600 counties and similar political subdivisions, which contain almost two-thirds of the total nonfarm population. To relate mortgage recordings as closely as possible to financing of 1- to 4-family homes, only instruments with a face amount of \$20,000 or less on properties in nonfarm areas are included. For data for January 1939 to August 1941 see note marked "*" on p. S-5 of the November 1942 Survey.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1943		1942

* Revised.

† Minor revisions have been made in the data beginning January 1939; data are available on request.

§ The number of reporting firms was greatly increased in September and October 1942 and data are now based on reports from over 700 warehousing firms operating nearly 2,000 merchandise warehouse buildings: Comparison of the revised August figure above based on the enlarged sample with the previous figures for August, 83.6, indicates that the ratios were not materially affected by the change in the coverage of the reports.

* New series. The new indexes of advertising are compiled by J. K. Lasser & Co. for "Tide" magazine; the combined index includes radio (network only prior to July 1941 and network and spot advertising beginning with that month) farm papers, and outdoor advertising, for which separate indexes are computed by the compiling agency, in addition to magazine and newspaper advertising shown above; data beginning 1935 will be published in a subsequent issue. For data beginning 1929 for the series on consumer expenditures and a description of the data, see pp. 8-14 of the October 1942 Survey. Minor revisions in data for January through September 1941 are available on request.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1942

* Revised.

† Preliminary.

‡ See note marked "†" on p. S-7.

§ A few revisions in data for 1938-41, resulting from changes in the seasonal adjustment factors, are shown on p. S-8 of the November 1942 Survey.

¶ Revised series. Indexes of department store sales for Atlanta district revised beginning 1935, see p. 22, table 19, of the December 1942 Survey. Revised data beginning 1919 for the Cleveland district will be published in a later issue. The estimates of employees in nonagricultural establishments and in each of the component groups, with the exception of the trade group and the financial, service, and miscellaneous group, have been revised beginning 1939 and revisions of the earlier data are in progress; the revised data will be published when revisions are completed (data beginning August 1941 are in the October 1942 Survey).

* New series. Indexes of instalment accounts and collection ratios for furniture, jewelry, and household appliance stores beginning January 1940 will be shown in a subsequent issue (a new series on amount of instalment accounts outstanding is included on p. S-16). The estimates of civilian labor force, employment, and unemployment relate to persons 14 years of age and over employed or seeking work, excluding institutional population and the estimated number of persons in the armed forces; persons on public emergency projects are included with the unemployed; data beginning April 1940 will be shown in a subsequent issue. Data beginning 1939 for the new series on wage earners in manufacturing industries will also be shown in a later issue; the figures shown above and on p. S-9 for all manufacturing, durable goods, nondurable goods, and the industry groups have been revised in this issue and figures previously published for these series are not comparable with the current data.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1942

* Revised.
 † Adjusted indexes of manufacturing employment have not as yet been computed on a revised basis corresponding to the unadjusted indexes on a 1939 base which have been substituted for the indexes on a 1923-25 base formerly

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1943	1942											
	January	January	February	March	April	May	June	July	August	September	October	November	December

† Revised. § Weekly average of number receiving benefits, based on an average of the weeks of unemployment compensated during weeks ended within the month.
 † Not comparable with data prior to July 1942, owing to change in active file definition (see note 1 on p. S-11 of the December 1942 Survey). The July 1942 figure is also not comparable with figures for later months, as data for July were not completely revised to the new basis.
 † Data for years prior to 1940, comparable with data beginning with that year published in the 1942 Supplement and currently, will be shown in a subsequent issue.
 † Revised series. Indexes of weekly wages (formerly designated pay rolls) in manufacturing industries have been

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1942

• Revised. • Preliminary. • None held by Federal Reserve banks. • Less than \$500,000.
 † No data available for small amounts expended after June 1942 for the CCC now in process of liquidation as directed by Congress.
 ‡ Beginning with July 1942 only amounts expended for the student work program are included; need is no longer a criterion for enrollment in the out-of-school work program, which is focused on training inexperienced youths for war industries, and the program is therefore dropped from this series.
 § Construction wage rates as of Feb. 1, 1943: Common labor, \$0.832; skilled labor, \$1.61.
 ¶ See note marked "†" on p. S-12.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1942

Revised.

For bond yields see p. S-19.

No tax-exempt notes outstanding within maturity range after Mar. 15, 1942. Average shown for March 1942 covers only first half of month.

Amount estimated for one bank.

To avoid duplication these loans are excluded from the totals.

Bills and certificates of indebtedness beginning April 1942.

New series. Earlier data for the series on taxable Treasury notes appear on p. S-14 of the April 1942 Survey.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1943	1941	1942

* Revised. † 136 companies having 82 percent of the total assets of all United States legal reserve companies.
 § Revisions in 1941 data for credit unions are shown on p. S-15 of the January 1943 Survey.
 * New series. Earlier figures and description of the data appear on pp. 9-25 of the November 1942 Survey; subsequent revisions in 1941 data for total short-term debt (dollar figures and indexes), total cash loan debt, and commercial banks are shown on p. S-15 of the February survey. Minor revisions in service debt are available upon request.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1942

* Revised. * Preliminary.
 1 The index for the utilities and the composite have been discontinued because several of the utility companies included in the indexes no longer report their earnings quarterly.
 2 Revised to include reports received first few days of September on account of August sales.
 3 Less than \$500,000.
 4 Covers all loans for national defense beginning October 1942; prior to October some defense loans are included in "other loans and authorizations."
 5 Number of companies varies slightly.
 6 The total includes guaranteed debentures of certain agencies not shown separately.
 7 Includes repayments unallocated, pending advices, at end of month.
 8 For revisions beginning July 1941, see p. S-17 of the November 1942 issue.
 9 New series. For explanation of the new series on the war program see the footnotes to table 9, p. 21 of the April 1942 Survey. Figures have been revised since publication of data in the April Survey. Revised monthly data for program and commitments prior to June 1942 are not yet available. The series on war savings bonds is from the Treasury Department and represents funds received during the months from sales of series E, F, and G; for earlier data see p. S-16 of the October 1942 Survey.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1942

*New series. The new bond series represents the average yield of taxable Treasury bonds (interest subject to both the normal and surtax rates of the Federal income tax) neither due nor callable for 12 years; this average started Oct. 20, 1941, following the issuance of the second series of such bonds; the 2½ percent bonds of 1962-67 and the 2½ percent bonds of 1963-68 are excluded because of restrictions on their purchase and negotiability. For available earlier data for the new series on dividend payments and a description of the data, see pp. 26-28 of the November 1942 issue, except for revisions in 1941 data shown on p. S-19 of the January 1943 Survey.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1943		1942

* Revised.
 † Figures overstated owing to inclusion in the December statistics of an unusually large volume of shipments actually exported and imported in earlier months.
 * New series. For a description of the transportation indexes and earlier data, except as noted, see pp. 20-28 of the September 1942 Survey.
 ‡ Revised or added since publication of data in the September Survey; earlier indexes will be published in a subsequent issue.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1943	1942

† Not available. ‡ Deficit. § Revised.
 † Quarterly data. Data compiled monthly beginning July 1942.
 ‡ Data beginning September 1942 include a certain amount of superphosphate formerly reported in dry and mixed base goods not previously included with bulk superphosphate. The stock figure as of August 31, comparable with September data is 1,129,790 tons; no other data are available for comparison. Data are currently reported on an 18% A. P. A. basis and are here converted to a 16% basis so that they are comparable with prior figures.
 § This price has been substituted beginning 1935 for the one shown in the 1942 Supplement. Revisions for January 1935-July 1937 will be shown in a subsequent issue. There has been no change in data beginning with August 1937. Prices are quoted per ton, in 100-lb. bags, and have been converted to price per bag.
 ¶ Data for last two quarters of 1941 revised. Revisions for fish oil production are as follows: Quarter ending September, 99,306; quarter ending December, 94,450. Revisions for consumption and stocks of fish oils and for all other indicated series are minor and are available on request.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1942

† Revised. 1 December 1 estimate. 2 For domestic consumption only, excluding grindings for export. 3 Includes old crop only.
 † Data for the utilization of fluid milk in manufactured dairy products have been revised beginning 1920 to include the milk equivalent of dry whole milk; revisions are minor throughout. Final revisions for 1941 for production of dry skim milk, superseding those shown on p. S-25 of the November 1942 Survey, are as follows (thous. of lbs.): Total—Jan., 35,514; Feb., 35,604; Mar., 43,473; Apr., 48,223; May, 59,616; June, 56,143; July 41, 777; Aug., 36,913; Sept., 33,003; Oct., 29,183; Nov., 26,316; Dec., 31,272. For human consumption—Jan., 25,714; Feb., 25,715; Mar., 31,142; Apr., 34,449; May, 43,781; June, 41,780; July, 31,953; Aug., 29,293; Sept., 27,018; Oct., 25,253; Nov., 22,816; Dec., 27,543. Data for corn grindings revised beginning October 1941 through December 1942 to include grindings for export.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1942

† Data beginning with June 1942 include comparatively small amounts of wheat owned by the Commodity Credit Corporation stored off farms in its own steel and wooden bins, not included in the break-down of stocks. June figures include only old wheat; new wheat not reported in stock figures until crop year begins in July.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1943	1942

† Revised

† Lumber statistics for 1941 and 1942 have been revised to data from the 1941 Census of Forest Products. Revisions have been made also in earlier figures for total lumber stocks, hardwood stocks, and softwood stocks, and new orders, production, and shipments of west coast woods, on the basis of additional information now available; see pp. 27 and 28, table 2, of this issue.

† Statistics for 1942 have been revised to include data received too late for publication in the current monthly reports.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1943		1942

* Revised.
 † Cancellations exceeded orders booked during the month by 13,480 short tons.
 ‡ Data reported beginning September 1942 are not comparable with earlier data; the series has therefore been temporarily discontinued in the Survey.
 § Beginning July 1942, percent of capacity is calculated on annual capacity as of July 1, 1942, of 89,194,520 tons of open-hearth, Bessemer, and electric steel ingots and steel for castings.
 * New series. The data on scrap iron and steel and pig iron consumption and stocks are estimated industry totals compiled by the U. S. Department of Interior, Bureau of Mines, based on reports from consumers accounting for 96 to 99 percent of the industry total beginning in the latter half of 1941 and 93 to 95 percent in the earlier period. Data for January-October 1941 are shown on p. S-30 of the April 1942 Survey. Prior to 1941 data were collected only for the last month of each quarter. For available 1939 and 1940 data, see note marked "" on p. S-29 of the November 1942 issue. Consumers' stocks of pig iron include suppliers' and producers' stocks.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1942

* Revised.

† Cancellations exceeded new orders by the amounts shown above as negative items.

‡ Collection of data discontinued.

§ One manufacturer previously reporting went out of business in 1941.

¶ Of the 101 firms on the reporting list in 1941, 18 have discontinued the manufacture of stokers; some manufacture stokers only occasionally; for December 1942 and January 1943 only 47 firms reported sales.

* New series. The series for machine tools covers total shipments as reported to the War Production Board beginning December 1941; earlier data, available beginning January 1940, are estimated industry totals, compiled by the National Machine Tool Builders' Association from reports covering around 95 percent of the industry. Presses and other metal-forming machines are not included. For 1940 data and 1941 through August, see note marked "*" on p. S-30 of the November 1942 issue.

† Revised series. A new method has been employed in the construction of the indexes for electrical products to overcome a strong upward bias in the two series on orders received, and, in addition, the number of products composing the individual indexes has been increased. Earlier data will be published in a subsequent issue.

‡ Of the 99 manufacturers on the reporting list January 1, 1942, 21 have discontinued shipments of these products for the duration of the war.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1943	1942

1 Discontinued by compiling agency. * Revised.
 † Beginning January 1942 figures for the production of natural gasoline include total sales of liquefied petroleum gas as follows (thous. of barrels): Jan., 710; Feb., 577; Mar., 556; Apr. 572; May, 483; June, 498; July, 536; Aug., 502; Sept., 579; Oct., 663; Nov., 687; Dec., 832; data for such sales have not been included in the total for motor fuel; data for 1941 are available on request. Prior to 1941 an indeterminate amount of liquefied petroleum gas has been included in total motor fuel and natural gasoline production.
 ‡ Data revised for 1941. Revisions are as follows: Crude petroleum production—Jan., 119,446; Feb., 100,659; Mar., 112,648; Apr., 110,550; May, 116,941; June, 114,854; July, 117,843; Aug., 121,159; Sept., 119,320; Oct., 125,891; Nov., 123,483; Dec., 128,434. Stocks, refinable in U. S.—total, Jan., 263,881; Feb., 265,062; Mar., 267,005; Apr., 266,637; May, 262,731; June, 259,695; July, 255,998; Aug., 250,240; Sept., 246,731; Oct., 244,355; Nov., 244,299; Dec., 247,499; on leases, Jan., 11,630; Feb., 11,587; Mar., 11,786; Apr., 11,750; May 11,618; June, 11,709; July 11,809; Aug., 12,079; Sept., 12,006; Oct., 12,030; Nov., 12,617; Dec., 12,188. Wells completed—Jan., 1,368; Feb., 1,150; June, 1,599; Aug., 1,820; Sept., 1,913; Dec., 1,447. Motor fuel production—total, Jan., 53,384; Feb., 49,155; Mar., 54,221; Apr., 54,493; May, 59,072; June, 57,689; July, 60,594; Aug., 61,578; Sept., 61,067; Oct. 63,273; Nov., 62,187; Dec., 64,581; benzol, Jan., 310; Feb., 278; Mar., 314; Apr., 275; May, 286; June, 273; July, 269; Aug., 267; Sept., 264; Oct., 294; Nov., 284; Dec., 321; natural gasoline, Jan., 6,277; Feb., 5,843; Mar., 6,259; Apr., 6,225; May, 6,475; June, 6,324; July, 6,772; Aug., 6,966; Sept., 7,057; Oct., 7,452; Nov., 7,501; Dec., 7,704.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1942

^a Revised.

¹ Total ginnings of 1941 crop.

² December 1 estimate of 1942 crop.

³ Partially estimated.

⁴ Total ginnings to end of month indicated.

⁵ For revised figures for all months of the cotton year 1941-42, see p. S-34 of the November 1942 Survey. The total stocks of American cotton in the United States on July 31, 1942, including stocks on farms and in transit, was 10,455,000 bales.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1942

† Revised. ‡ No quotation.
 † For revised figures for all months of the cotton year 1941-42, see p. S-35 of the November 1942 Survey.
 ‡ Data for March, June, and September 1942 and January 1943 are for 5 weeks; other months, 4 weeks.
 † Revised series. The yarn price series for Southern, 22/1, cones, has been substituted beginning January 1941 for the Northern, mulespun, series formerly shown; for data for all months of 1941, see p. S-35 of the November 1942 issue. Figures for wool stocks are compiled on a revised basis beginning 1942 and data are not available comparable with figures shown in the 1942 Supplement and in monthly issues through June 1942. 1942 data shown above cover all known stocks of wool in commercial channels, including stocks in the hands of country dealers and in country warehouses; stocks in the hands of country dealers and in country warehouses are not included in the earlier data. All figures exclude stocks afloat which are no longer available for publication. For data for March and June 1941 for wool finer than 40s, see p. S-37 of the October 1942 Survey. The indexes of retail automobile financing shown above on a January 1942 base may be linked to the indexes on a 1939 base shown in the 1942 Supplement by applying the current series to the January 1942 index on a 1939 base given in footnote 5 to p. 170 of the 1942 Supplement.

Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey	1943		1942

* Revised.

† Revised series. The revision of the index of physical volume of business is due mainly to a change in the weighting and in the list of components, so as to present a picture of the expansion in industries engaged on war production. Revised data were first shown on p. S-36 of the December 1942 Survey; there has been a subsequent revision, however, in the construction index as shown in this issue. Revised indexes beginning January 1940 will be published in a subsequent Survey. The index of grain marketings is based on receipts at country elevators instead of receipts at head of Lake and Pacific ports, as formerly. For data beginning February 1941, see p. S-38 of the April 1942 Survey. Revisions for January 1941 are as follows: Total, 168.8; grain, 185.4. Earlier data will be shown in a subsequent issue.

* New series. The index of tons carried has been substituted for the index of carloadings; data beginning 1928 will appear in a subsequent issue. Components included in the distribution index other than tons carried are retail sales, wholesale sales, exports, and imports.
