# the BUSINESS SITUATION

CHART 1

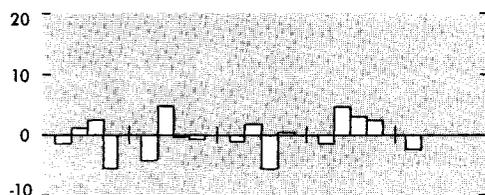

## GNP up \$40½ billion in first quarter

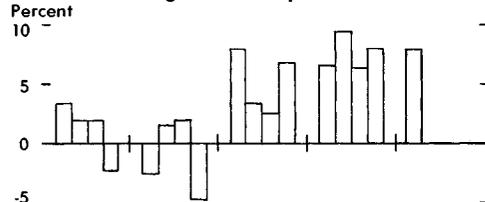

## FINAL SALES rose \$43 billion

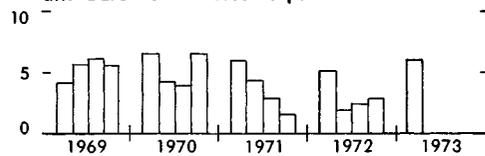

## INVENTORY INVESTMENT declined \$2½ billion

## REAL OUTPUT grew about 8 percent

## GNP DEFLATOR increased 6 percent

Change From Previous Quarter  
Seasonally Adjusted at Annual Rates

GROSS national product in constant prices increased 7.9 percent at an annual rate in the first quarter, about the same as the fourth quarter expansion (chart 1). In current prices, the increase was 14.3 percent, or \$40.6 billion. The rate of price change as measured by the implicit GNP deflator was 6 percent, a disturbingly high figure, compared with 2.8 percent in the fourth quarter. Part of that acceleration was caused by a January increase in Federal pay schedules; such increases enter the national accounts as straight increases in the price of government product. The implicit price deflator for private product, which was unaffected by the pay raise, increased at a rate of 5.5 percent in the first quarter compared with 2.8 percent in the fourth, with much of the acceleration caused by sharply rising food prices.

The major GNP components generally registered first quarter advances that were sizable but not out of line with recent trends or with widely held expectations. The exceptions were consumption spending, which increased very steeply not only in current prices but also in real terms, and inventory accumulation, which is estimated to have declined from the fourth quarter to the first. Business fixed investment, residential investment, and government purchases all increased quite solidly. Higher employee compensation—due to both pay raises and employment growth—accounted for some \$5 billion of the \$7½ billion increase in combined Federal, State, and local government purchases. The Federal pay raise in January was responsible for about \$2 billion of the advance in compensation.

Employment grew substantially in the first quarter, as measured both by the household survey of the civilian population and by the survey of non-

farm establishments. The first quarter gains in the employment aggregates reflected continuation of the strong growth that has marked the past year (table 1). However, growth of the civilian labor force has slowed, at least partly because the reduction of the armed forces is over; that reduction augmented the natural growth of the civilian population and thus of the civilian labor force.

Because the growth of employment in the first quarter was faster than the growth of the labor force, the unemployment rate dropped measurably—from 5.3 percent in the fourth quarter to 5.0 percent in the first. The rate had

dropped 0.3 percentage point in the fourth quarter as well, but in the year before that the declines were only 0.1 point per quarter.

## Price increases

The rate of price increase was escalating in the opening months of this year

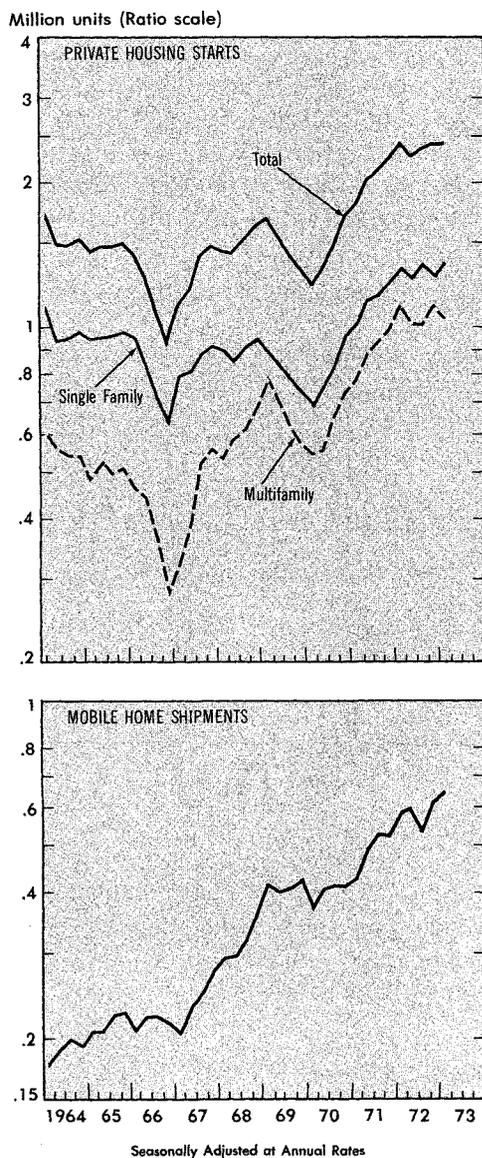

in both consumer and wholesale markets. Most of the acceleration was in agricultural prices, but at the wholesale level the price index for industrial commodities was also rising sharply. A large part of the acceleration of the industrial price increase was due to advances for lumber and wood products, and fuel and power; however, the most recent data indicate a more pervasive pattern of increases, with sharp advances for the metals, pulp and paper, textile and apparel, and machinery groups.

The implicit price deflator for gross private product, whose annual rate of increase accelerated from 2.8 percent in the fourth quarter to 5.5 percent in the first, is based on shifting weights that reflect changes in the composition of GNP, and shifts in the weights can sometimes have a sizable impact on the change in the deflator; the wholesale and consumer price indexes, on the other hand, are based on fixed weights. An alternative measure of price change for gross private product is the chain price index, which uses the weights of the prior quarter in the calculation of each quarter's price change. The annual rate of increase in the chain index accelerated from 2.9 percent in the fourth quarter to 6.1 percent in the first (table 2). A significant part of that acceleration was due to food prices. Another element contributing to the acceleration was automobile prices. The deflator for

The GNP component is meant to represent the change in the physical volume of inventories valued at average prices during the period. This is not necessarily the same as the change in the book value of inventories, for the latter can change without any net change in volume but simply because goods in stock turn over and the prices at which the replacement goods are valued differ from the prices of the goods removed from inventory. The difference between book value change and the GNP component is the inventory valuation adjustment (IVA). Available data for the first quarter indicate that book values of manufacturing and trade inventories were rising very rapidly, and faster than in the fourth quarter. However, the prices at which goods in inventory are valued were also rising very sharply, and the estimated IVA is much larger in the first quarter than in the fourth.

The estimated first quarter rate is very modest relative to total GNP, and it seems likely that in some business sectors the strength of final sales was responsible for holding accumulation down. There is scattered evidence of tightening supply situations. For instance, purchasing agent surveys indicate that lengthening delivery times on orders of materials and supplies are increasingly common, and that a steadily increasing number of companies are placing their orders with relatively long lead times.

CHART 2  
**Residential Construction and Mobile Homes**

**Table 2.—Measures of Price Change**  
[Percent change from previous quarter, seasonally adjusted at annual rate]

	1972-IV	1973-I	Difference
Implicit price deflator, GNP.....	2.8	6.0	3.2
Implicit price deflator, gross private product.....	2.8	5.5	2.7

Excluding food.....	2.3	4.4	2.1
Excluding autos.....	3.4	6.2	2.8
Excluding food and autos.....	2.7	4.4	1.7

autos had declined in the fourth quarter because the 1973-model cars were introduced with additional "quality" but at unchanged dollar prices; the dollar prices were raised subsequently, and that increase had the effect of moving the auto deflator back up in the first quarter. Excluding the impact of both food and auto prices, the chain index rose 2.7 percent in the fourth quarter and 4.4 percent in the first.

**Inventory investment**

On the basis of incomplete data, the inventory accumulation component of GNP is estimated to have declined from an annual rate of \$10¼ billion in the fourth quarter to \$8 billion in the first.

**Fixed investment**

Business fixed investment continued its solid advance in the first quarter, rising \$6¼ billion (annual rate); spending for equipment rose \$3¼ billion and investment in nonresidential structures rose \$2½ billion. The strong increase in expenditures for equipment continued the expansion that began in early 1971. In the case of structures, however, outlays had shown very little growth until the fourth quarter of 1972, when they rose \$2 billion.

According to the BEA survey of spending expectations reported last month, businessmen are planning to increase outlays 14 percent from 1972 to 1973. That is a very large increase and

a sizable jump from the 9 percent expansion in 1972, but it is conceivable that a continuation of exceptionally strong growth of other final demands could lead to some upward revision of spending plans this year.

Residential construction outlays increased \$2¼ billion in the first quarter. That was a bit less than the rise in the fourth quarter of last year, reflecting the fact that the rate of homebuilding has leveled off. Housing starts were at a very high rate in January and February and fell somewhat in March, and averaged an annual rate of 2.4 million units for the quarter—a rate that was first reached in the opening quarter of 1972 and maintained through most of last year. Residential construction permits averaged a rate of just under 2.2 million units in the first quarter, only slightly below the rate for the fourth quarter. Sales of single-family homes continued at high rates early in the first quarter, although inventories of unsold homes were rising and the ratio of homes for sale to homes sold reached the highest levels since 1969. In the apartment rental market, the vacancy rate in the fourth quarter (the latest period for which data are available) was only moderately above the low rate of 1970 and early 1971.

### Consumer Demand and Income

Consumer demand expanded sharply in the first quarter. Purchases of goods and services increased \$28 billion (annual rate), a huge acceleration from the 1972 quarterly average of \$16 billion. Spending for autos and parts rose \$4¼ billion and spending for other durable goods rose \$4½ billion, with an exceptionally large advance for furniture and other household durables. The \$9¼ billion rise in total durables spending followed a \$2¼ billion advance in the fourth quarter of 1972 and a quarterly average last year of somewhat less than \$3¼ billion. The growth of spending for nondurable goods also accelerated in the first quarter. The sharpest acceleration was for food, but the increase in that demand category appears to have been due almost en-

tirely to higher prices. In other major nondurables categories, however, there were large increases in spending—especially for apparel—that reflected substantial real advances.

### New car sales

In unit terms, sales of new cars in the first quarter hit an extraordinary annual rate of 12½ million, counting both domestic and import models. The total for the calendar year 1972 was 11 million, a record, and in the second half of 1972 sales were running at a seasonally adjusted annual rate of about 11½ million.

Monthly sales of domestic models were at annual rates above 9 million after early 1972, and totaled 9.3 million for the year—well above the previous record of 8.7 million in 1971. In January and February 1973, the domestic model sales rate jumped above 10 million, and in March it exceeded 11 million. These very high rates have held down the growth of dealer inventories in a period of the year when stocks are built up in preparation for the spring selling season. Relative to the recent sales rate, inventories are very low, and even in terms of actual number of cars the stocks are unusually low for the early spring.

Sales of import models were at a rate of 1.9 million in January and reached 2 million in February and March. These exceptionally high rates—the 1972 total was 1.6 million—may reflect some rushing to buy cars already in stock so as to avoid the price impact of the February devaluation of the dollar. It was mentioned in the last month's *Survey* that price increases for Japanese cars were expected shortly, and these were announced in early April. They amounted to about 10 percent for the popular Toyota and Datsun models.

### Income and consumption

Interpretation of the data on consumer income and spending has been clouded during the past year by the overwithholding phenomenon, and an additional, but quite temporary, distortion to the data was caused by the large increase in social security benefits

that went into effect in October. That increase boosted the flow of disposable income by about \$8 billion (annual rate) as of the fourth quarter, but the full effect on the spending stream was evidently not felt in that quarter for the saving rate jumped sharply. (This is a rather common pattern when social security benefits are raised.) Thus, it is probable that part of the very large first quarter increase in spending was in fact a delayed result of the income increase that occurred in the fourth quarter.

Throughout 1972, overwithholding caused disposable income to be smaller than it otherwise would have been—i.e., than it would have been if taxpayers had taken the action necessary to tailor their withheld taxes to match their liabilities. In the first half of this year, as tax returns are filed, the 1972 overwithholding is being offset by a larger-than-otherwise final settlement between the Treasury and taxpayers. (Final settlement refers to tax refunds net of final tax payments to the Treasury; this year, refunds are larger than they otherwise would have been and final payments are smaller.)

Overwithholding resulted from the introduction in January 1972 of new withholding schedules intended to reduce the underwithholding experienced by certain taxpayers, and to permit taxpayers to establish a close match between withholdings and liabilities. No tax increase was involved but it was recognized that many taxpayers would be significantly overwithheld unless they acted to claim additional exemptions for withholding purposes. For the most part, taxpayers did not make this adjustment.

What effect is this phenomenon likely to have had on consumption? There is no simple, obvious answer, but it is certainly reasonable to believe that the spending surge in the first quarter of 1973 was related to the start of the return flow of 1972 overwithholdings.

If consumers last year understood the overwithholding phenomenon—that it involves an interest-free, short-term loan to the Treasury—they may well have treated it as a "Christmas club" type of savings account that would be

paid back to them at a specified time. In that case, a likely pattern of behavior would have been for consumers to cut spending somewhat in 1972, relative to what it otherwise would have been, and to spend heavily when the "savings account" was paid out in early 1973. However, just the same sort of spending pattern could have resulted if consumers did not understand overwithholding and thought that taxes had been raised—a belief that was in fact evidently held by quite a number of taxpayers. In that case, too, consumers would presumably have cut spending somewhat in 1972 and then have spent heavily when they received unexpected income in early 1973. In neither case is there any obvious basis for concluding that total consumer spending in the affected period—1972 and early 1973 together—was either larger or smaller than it would have been in the absence of overwithholding.

#### ***Overwithholding and disposable income***

Treasury estimates indicate that receipts of withheld taxes were about \$10 billion larger in calendar year 1972 than they would have been in the absence of overwithholding. This was partly offset by an associated reduction, estimated at about \$1 billion, in receipts of estimated taxes paid in quarterly declarations. Thus, there was a net overwithholding of about \$9 billion in 1972, to be offset in 1973 by a larger-than-otherwise final settlement.

BEA calculates seasonally adjusted personal tax payments in order to arrive at seasonally adjusted estimates of disposable income (and of Federal receipts). At a seasonally adjusted annual rate, the overwithholding in 1972 can be considered as having run at \$9 billion—the full-year amount—in each quarter. For 1973, it is necessary to estimate how much of the overwithholding is to remain permanently and how much will prove to have been transitory. That is, will taxpayers act to cut the overwithholding, and if so by how much? The permanent element of overwithholding, and the equivalent permanent final settlement will be recurring phenomena and should be

smoothed so that they do not, of themselves, have any net impact on seasonally adjusted disposable income (or seasonally adjusted Federal receipts). The transitory element in the final settlement this year should be allowed to affect seasonally adjusted disposable income (and Federal receipts) at the time that the settlements are made.

Data on Treasury receipts of withheld taxes in the first 3 months of 1973 suggest little if any change in the amount of overwithholding, but the Treasury currently expects that taxpayers will in fact reduce the amount; the current estimate, subject to revision, is that the permanent amount of overwithholding will be about \$7¼ billion, and that the reduction to this rate will occur by midyear. This implies that only about \$1¼ billion of the total \$9 billion of the larger-than-otherwise final settlement this year is transitory. Treasury data on refund payments suggest that refunds—and

thus the \$1¼ billion transitory element—are concentrated in the second quarter of 1973.

To summarize, current calculations and estimates suggest that the net impact of overwithholding on the size of disposable income at a seasonally adjusted annual rate is about as follows: a negative \$9 billion in each quarter of 1972; approximate neutrality in the first quarter of 1973, as continued payments of overwithholding to the Treasury were about offset by extra-large final settlements, including a small transitory element; a positive impact of several billion dollars in the second quarter, as payments of overwithholding to the Treasury decline toward the "permanent" level while final settlements are swelled by the bulk of the transitory element; and neutrality thereafter, as the system is projected to settle down to the "permanent" flow of overwithholding and associated final settlements.

## Measure of Labor Earnings

THERE exist several major measures of labor earnings that differ in concept and coverage. This review examines the series on wage rates established in union contract settlements, average hourly and weekly earnings, and average weekly spendable earnings published by the Bureau of Labor Statistics, and the series on wages and salaries published by BEA. The series will be reviewed in the light of the cyclical developments in the economy since 1967. The focus will be on the aggregates and not on data for specific industries or sectors of the economy.

### ***Union contract settlements***

The Bureau of Labor Statistics publishes quarterly figures on the outcome of private nonfarm union contract negotiations. Data are provided on wage rate changes negotiated in contracts covering 1,000 or more workers, which represents somewhat more than 50 percent of all unionized workers and about 20 percent of all production and non-supervisory workers in the private nonfarm economy. Data on fringe benefits are included for contracts covering 5,000

or more workers. Though relatively few contracts are negotiated in any given quarter, the BLS series on outcomes is an important measure of what current gains are won and also an indicator of wage changes for the future. These contracts are typically negotiated in key sectors of the economy and tend to be widely reported and therefore to influence wage adjustments for other workers, both union and nonunion.

The BLS data cover all contracts negotiated during the quarter whether the outcome is an increase, decrease, or no change in wage rates. Changes in wage rates, expressed as a percentage of straight-time hourly earnings, are calculated both for the first year of the contract and over the life of the contract (which is typically more than 1 year). Wage changes resulting from cost-of-living escalator clauses are excluded except for increases guaranteed by the contract.

Negotiated wage increases accelerated sharply from 1968 through the recession year 1970, leveled off in 1971, and slowed appreciably in 1972 (table

3). In 1968-70, workers involved in contract negotiations pressed vigorously for large settlements both to catch up with the big gains won by others during the 2 or 3 years that these workers' contracts were not up for negotiation, and to offset the impact that inflation was having on real income. These efforts were reflected in an increase in "front loading", i.e., providing a disproportionate share of the total negotiated increase to become effective in the first year of the contract. The increase in the size of the average settlement from 1969 to 1970 was centered in nonmanufacturing industries, particularly in the construction industry, where bargaining was very heavy that year. In 1971, the average settlement dropped a bit, mainly because construction settlements fell back; this was partly due to the fact that 1971 was a relatively light bargaining year in construction, and to the introduction in the spring of 1971 of a system of wage restraints under the Construction Industry Stabilization Committee. Outside of construction, an unusually large number of contracts were signed in 1971, and the rise in wage settlements in manufacturing accelerated. In all probability, that acceleration would have been even greater had it not been for the imposition of the 90-day "Phase I" wage freeze in mid-August of 1971. In 1972, average negotiated wage increases diminished sharply, particularly in the construction industry, reflecting at least in part the impact of "Phase II" wage controls administered by the Construction Industry Stabilization Committee and the Pay Board.

### Hourly earnings

BLS calculates monthly data on average hourly earnings of production and nonsupervisory workers for the total private nonfarm economy and for many industries. Average hourly earnings are computed by dividing total gross earnings of full-time and part-time production workers (i.e., payrolls before deduction for social security, withheld taxes, union dues, insurance, etc.) by total man-hours paid for, including overtime hours and hours of paid sick, holiday, and vacation time. The earnings are direct wage payments

and do not include bonuses, tips, commissions, or fringe benefits.

Changes in average hourly earnings reflect not only changes in basic hourly wage rates but also changes in the amount of overtime and shifts in the composition of employment between high- and low-paid work. Thus, average hourly earnings should not be treated as a wage rate for a unit of time, such as is determined in union contracts. Also, the average hourly earnings figure should not be taken as representative of the hourly earnings of an "average" worker—for the figure is in effect a weighted average of the hourly earnings of a mix of workers including part-time and full-time, high-paid and low-paid, etc. Also, the series does not represent average labor cost per man-hour because it excludes bonuses, fringe benefits, etc.

The increase in the average hourly earnings series is highly sensitive to cyclical movements in economic activity. Earnings moved sharply higher during the tightening of labor markets in 1968 and 1969, and growth slowed noticeably in the recession year 1970 (table 4, line 1). Earnings increased very rapidly during the first half of 1971, partly because of heavy overtime to make up for losses associated with the late-1970 auto strike and partly because the return to work of high-paid automobile workers and others affected by the strike was in itself enough to boost the averages. The imposition of wage controls in midsummer 1971 cut sharply into the increases in the second half of that year. A post-freeze bulge of wage increases swelled the average for

the first quarter of 1972, but the increase from 1971 to 1972 was nonetheless fractionally smaller than from 1970 to 1971. The rate of increase tapered in the second and third quarters of 1972, but was accelerating toward yearend.

### Hourly earnings adjusted

Part of the cyclical behavior of average hourly earnings reflects changes in the amount of premium pay for overtime and shifts in the distribution of employment between high-paying and low-paying industries during different phases of the business cycle. For example, there are sizable shifts in employment to the high-paying durable goods manufacturing industries during cyclical expansions and away from them during contractions. BLS publishes an adjusted average hourly earnings series for the total private nonfarm economy and for seven industry divisions that is intended to abstract, at least in part, from all these influences. This series comes much closer than does gross average hourly earnings to being a measure of wage rate behavior.

Adjustment for changes in overtime pay is made for manufacturing (the only sector for which data on overtime are available); it is done on the assumption that all overtime hours are paid for at time-and-one-half. The adjustment for interindustry shifts in the composition of employment is done for manufacturing and nonmanufacturing industries and is made by assuming that the distribution of man-hours worked at the three-digit industry level (according to the Standard Industrial Classification) stays the same as

**Table 3.—Wage Rate Changes Provided by Contract Settlements Affecting 1,000 or More Workers**

	[Mean yearly percent change]

Note.—Data exclude possible but nonguaranteed adjustments in wages under cost-of-living escalator clauses.

Source: BLS

it was in 1967. Changes in adjusted hourly earnings thus essentially reflect changes in rates of pay, not shifts in the industry mix of employment. (However, the adjustment does not cover intra-industry shifts between low and high-paying jobs within three-digit industries.)

Cyclical changes in manufacturing overtime and in the industrial composition of employment have impacts on the conventionally calculated—i.e., not adjusted—average hourly earnings series. The effect of adjusting the conventional average hourly earnings for overtime and for changes in the industry mix of employment is to produce a somewhat smoother series; the adjusted series typically increases a little less rapidly than the unadjusted series during periods of economic recovery and more rapidly during periods of contraction.

#### Weekly earnings

Average hourly earnings multiplied by average weekly paid hours yields the average weekly earnings of production workers. This series is calculated by BLS for the total private nonfarm economy and for industries (at the three-digit level in the Standard Industrial Classification). The weekly figure, like average hourly earnings, is gross of all deductions, taxes, etc., it includes overtime pay and pay of full-time and part-time employees, and it is affected by employment shifts between high- and low-paying industries.

Average weekly earnings are of course affected by changes in the length of the workweek. Because em-

ployers adjust to changes in demand partly by varying hours of work, weekly earnings are more cyclically sensitive than are hourly earnings (table 4, line 3). For example, from the third quarter of 1969 (the period before the cyclical contraction in labor markets got underway) to the auto strike-depressed fourth quarter of 1970, average weekly earnings in the private nonfarm sector increased 5.5 percent, while average hourly earnings increased 7.4 percent. In the recovery, from the fourth quarter of 1970 to the fourth quarter of 1972, weekly earnings rose 14.5 percent and average hourly earnings increased 13.7 percent.

#### Spendable earnings

An important factor bearing on the wage earner's assessment of his economic well-being is his tax liability. BLS publishes a measure that goes part way toward calculating the impact that changes in tax liability have on "spendable" weekly earnings of a production worker—i.e., his weekly earnings net of liability for Federal income tax and social security tax. The series is based on the gross average weekly earnings series described above, and therefore includes the earnings of all production workers, whether single or married, female or male, young or old, part-time or full-time, etc. Accordingly, it reflects changes in the weight of these groups. In other words, it will change not only if the spendable earnings of one or more of these groups changes, but, to the extent that the average earnings of the several groups differ, also if the relative importance of these groups changes.

Average weekly earnings are annualized and annual Federal income tax and social security tax liability are calculated and deducted to arrive at "spendable earnings," which are then stated on a weekly basis. The calculation is done for a worker with one dependent and for a worker with three dependents. It is assumed that the average weekly earnings are the worker's only income and that he takes a standard tax deduction.

It is important to realize that the spendable earnings figure calculated for a worker with three dependents does not measure what workers with three dependents typically earn, as most such workers earn more than the average—because they are more likely to be full-time workers, in higher paid occupations and at higher levels in those occupations, and are more likely to work more than one job, i.e., to moonlight. The spendable earnings figure simply shows what a person with three dependents would have after meeting standard Federal tax liabilities if his weekly earnings were equal to the average for all workers. Moreover, wage earners have other tax liabilities—e.g., those to State and local governments—but there is no way to adjust for these taxes for the country as a whole. Also, no adjustment is made for deductions for such things as employee contributions to health insurance, retirement, union dues, etc., which have a significant impact on actual "spendable earnings."

Spendable weekly earnings (table 4 line 4) rose noticeably less than gross average weekly earnings in 1968 and 1969 and much faster than the gross

Table 4.—Change in Average Hourly, Average Weekly, and Average Spendable Weekly Earnings

average in 1971 and 1972. That pattern reflects marked variation in the growth of tax liabilities. From 1967 to 1969, tax liabilities rose 33 percent as compared with a 12½ percent increase in gross average weekly earnings. The surge in liabilities reflected the progressivity of the income tax structure, in a period when average earnings were rising sharply, increases in social security taxes, and—most importantly—the imposition in August 1968 of the 10-percent income tax surcharge that remained in effect through the end of 1969. In 1970, tax liabilities rose very little and less than weekly earnings, as tax reductions legislated in the Revenue Act of 1969 cut liabilities, and as the income tax surcharge was cut to 5 percent in January and eliminated in July. From 1970 to 1972, tax liabilities increased less than 1 percent while average weekly earnings rose 13.7 percent. The virtual stability in liabilities on rising earnings reflects the further reductions in tax burdens resulting from the Revenue Acts of 1969 and 1971 which more than offset increases in social security taxes.

#### *Purchasing power of labor earnings*

During a period of rapid inflation, such as the one that dominated much of the 1968-72 period, a worker may actually lose purchasing power even though his money earnings are increasing substantially. A widely used method for measuring real earnings is to deflate current dollar earnings by the Consumer Price Index (CPI). The CPI measures price changes for a fixed market basket of goods and services purchased by moderate-income, urban families in a specific base year. The goods and services in this market basket are weighted according to their relative importance in the consumer's budget in the base year. The market basket currently used was constructed from a 1960-61 survey of consumer expenditures, and accordingly is somewhat out of date; BLS is constructing a new market basket on the basis of a 1970-71 survey.

Average hourly earnings, average hourly earnings adjusted for overtime in manufacturing and for interindustry shifts in employment, average weekly

earnings, and average weekly spendable earnings are deflated by the CPI in table 4. As can be seen, inflation cut very heavily into the large increases in earnings in the 1968-70 period. The rate of inflation slowed moderately from 1970 to 1971 and sharply from 1971 to 1972, and the sizable gains in current dollar earnings translated into a strong acceleration in the growth of real earnings in both 1971 and 1972.

#### *BEA series on wages and salaries*

The review thus far has been confined to series published by BLS on collective bargaining gains and on the earnings of production or nonsupervisory workers. The Bureau of Economic Analysis calculates and publishes monthly aggregate wages and salaries as a component of the personal income series.

The wages and salaries series covers the income received by all employees and consists of regular and overtime pay (including sick, vacation, and holiday pay), commissions, tips, bonuses, and payments in kind (e.g., food and lodging). Estimates are published monthly for broad industry categories, but on an annual basis BEA publishes wages and salaries in considerable industry detail. BEA also makes annual estimates for these industries of the average number of full-time and part-time employees and of the number of full-time equivalent employees that are consistent with the wage and salary component of the national income and product accounts, and with the average annual earnings per full-time employee. (See tables 6.2 through 6.5 of the July issue of the SURVEY.)

Average annual earnings per full-time equivalent employee in the economy as a whole amounted to \$8,061 in 1971, and showed fairly stable growth during the 1967-71 period (table 5). The fact that growth of this average earnings figure did not decelerate in recession year 1970 was due mainly to the behavior of wages and salaries in the public sector—and mainly to a pay raise for Federal civilian and military employees. Growth of average wages and salaries per full-time equivalent employee in the private nonfarm economy was similar to that of the BLS series on average hourly earnings over the period under review, but showed less cyclical volatility than the BLS series on average weekly earnings. The latter reflects the fact that changes in the workweek of nonproduction workers (whose incomes are included in the average wages and salaries measure but excluded from average weekly earnings) are less pronounced than changes in the production workers' workweek.

In the framework of the national income and product accounts, supplements to wages and salaries, including employer contributions for social insurance, private pensions, health programs, compensation for injuries, etc., are added to wages and salaries to obtain a comprehensive measure of employee compensation. Although supplements account for only a small part of average compensation per full-time employee (11 percent of average compensation in 1971) they have been growing considerably faster than the wage and salary component in recent years, and have shown little cyclical sensitivity (table 5).

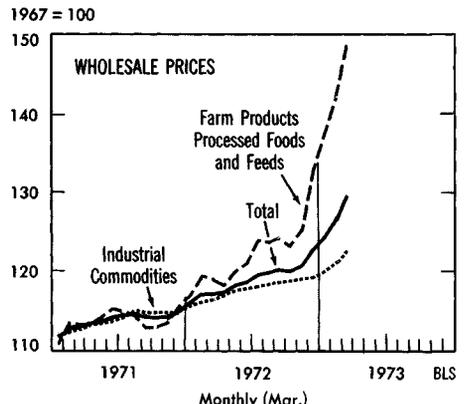

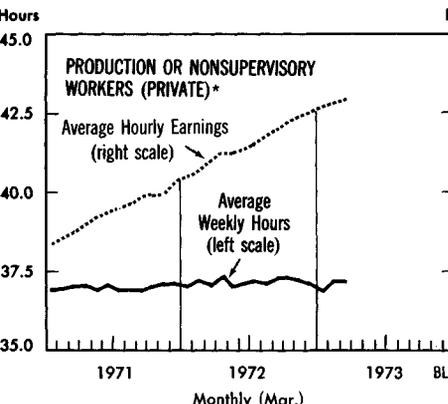

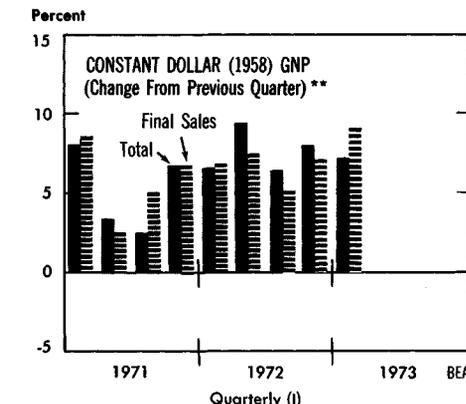

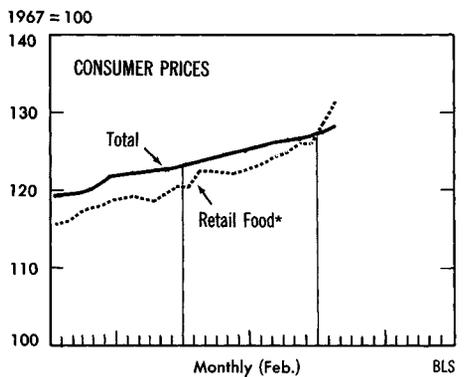

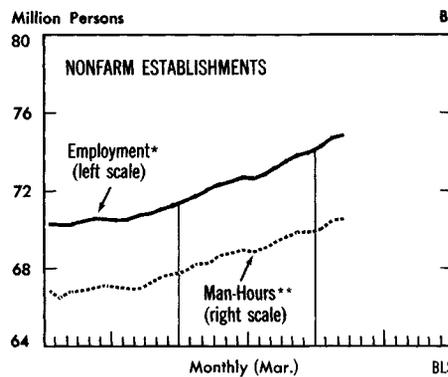

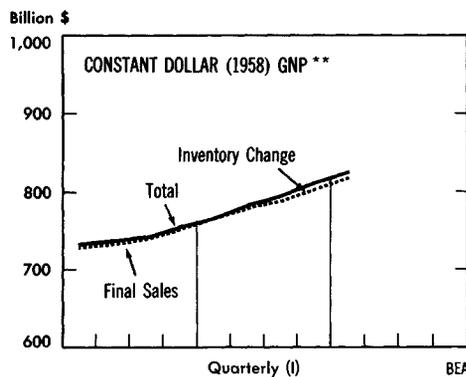

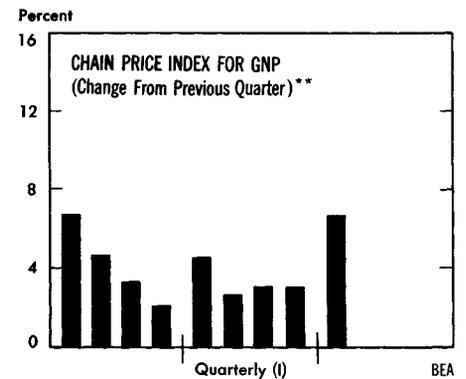

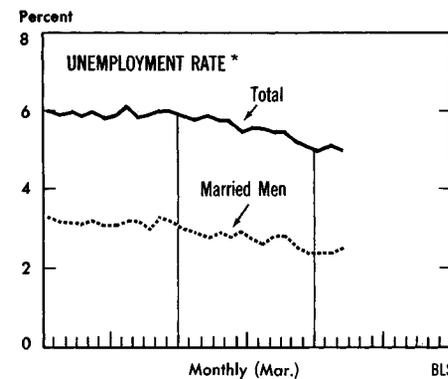

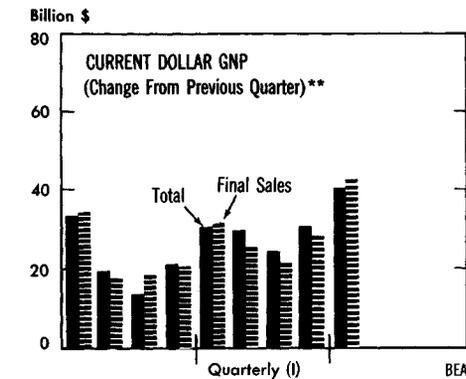

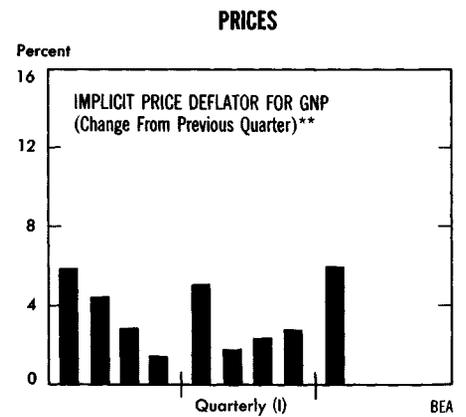

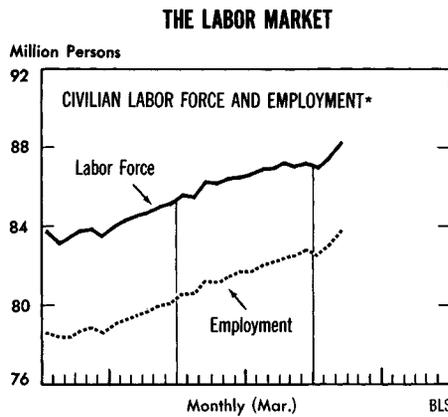

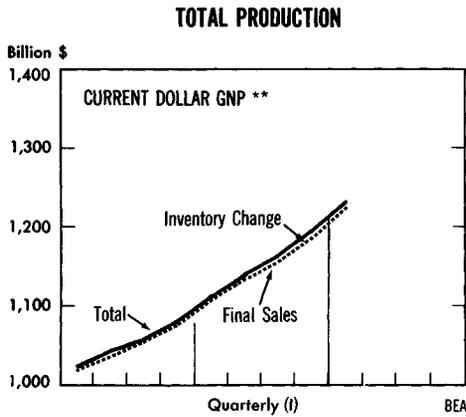

**Table 5.—Changes in Compensation, Wages and Salaries, and Supplements, per Full-time Equivalent Employee**

1. Includes farm.

- In first quarter GNP rose \$40½ billion; real output increased about 8 percent, (annual rate)
- In March: The unemployment rate dipped to 5 percent; nonfarm payroll employment increased 190,000
- Wholesale price index rose 2.2 percent; agricultural prices advanced 4.5 percent

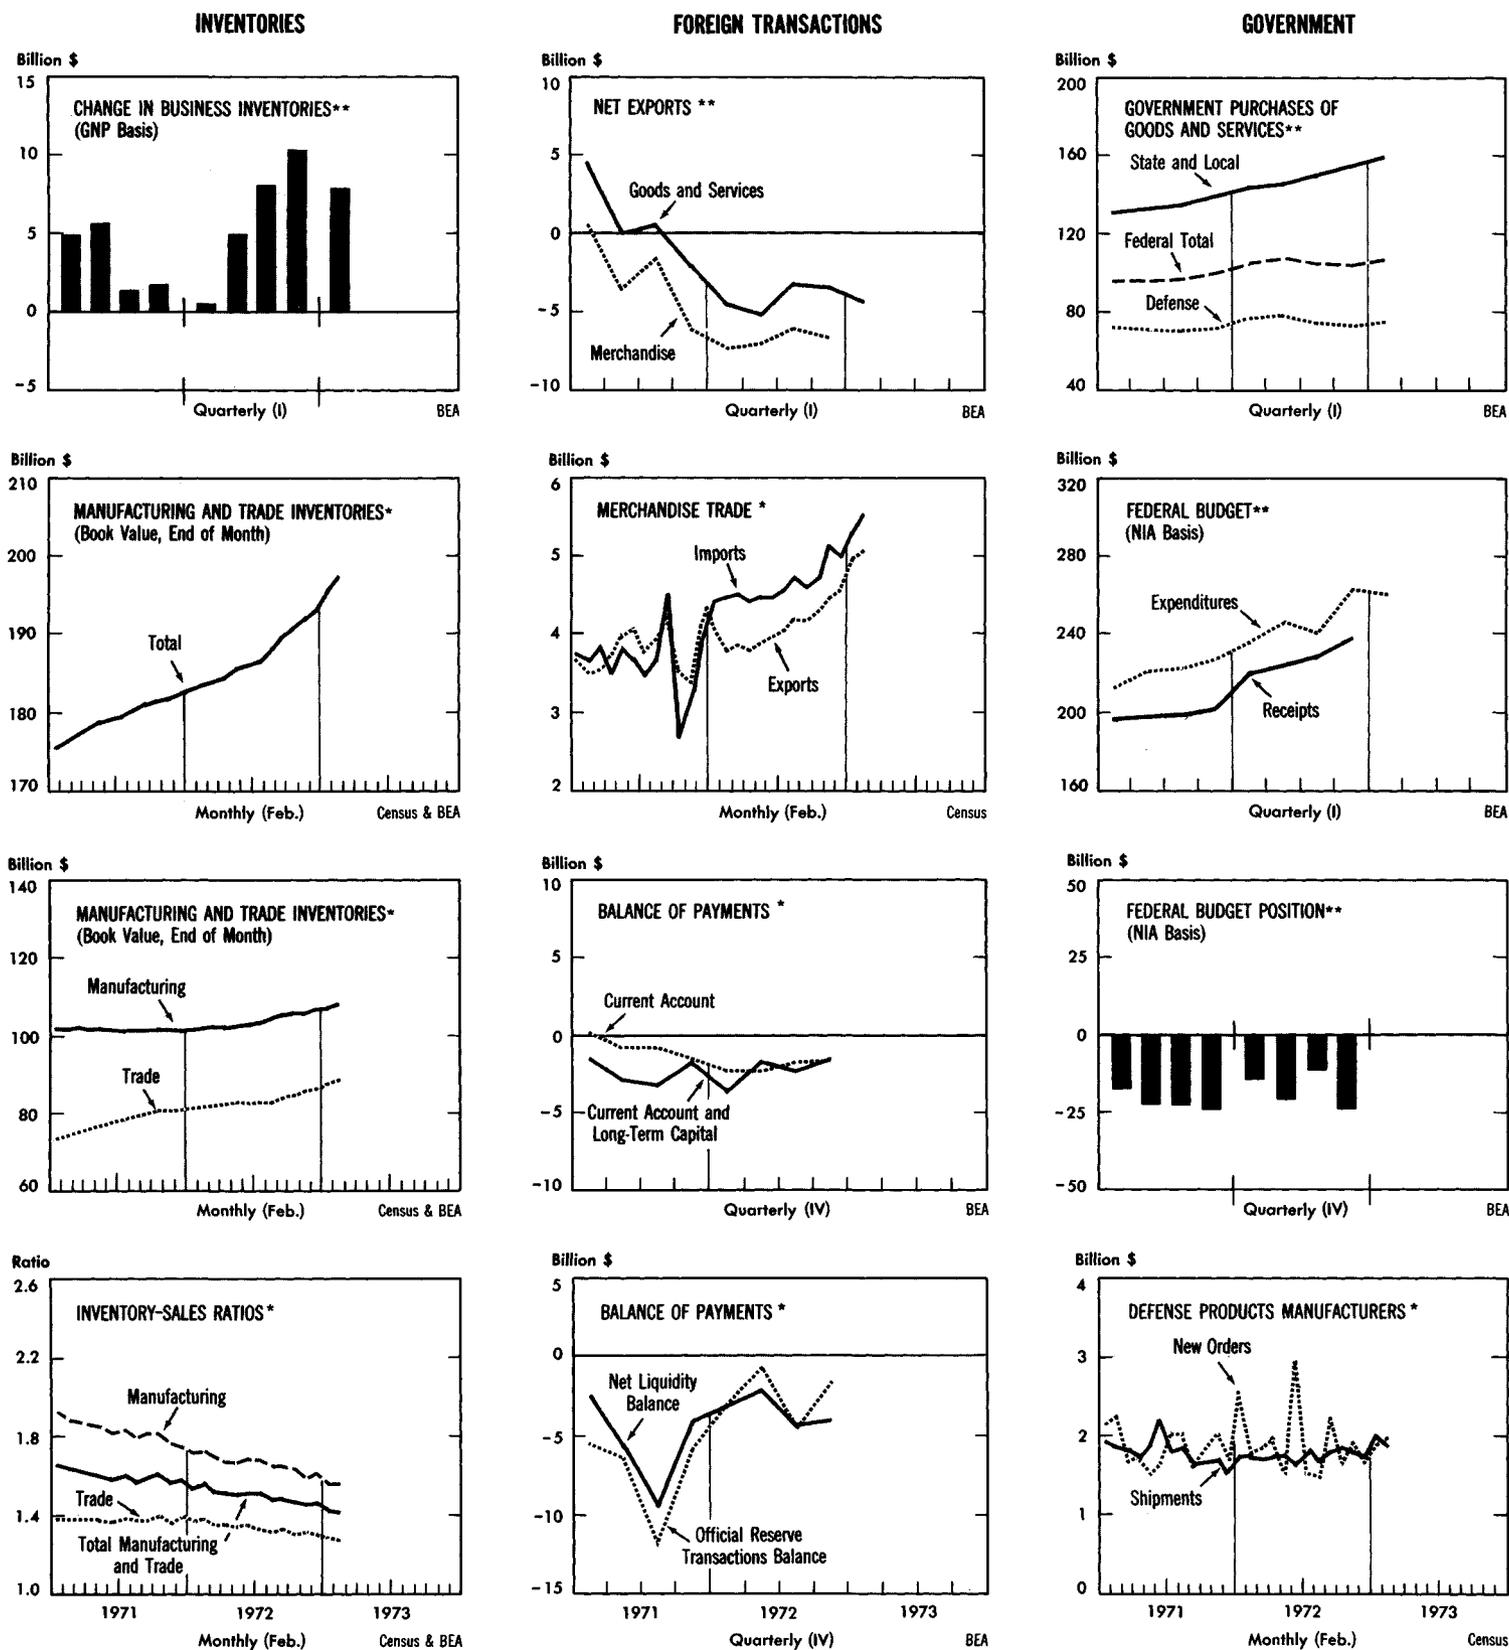

\*Seasonally Adjusted \*\*Seasonally Adjusted at Annual Rates

- In first quarter: Disposable personal income advanced \$22¾ billion
- Consumer spending showed a large increase of \$28 billion
- Business fixed investment rose \$6¼ billion; residential outlays up \$2¼ billion

\*Seasonally Adjusted \*\*Seasonally Adjusted at Annual Rates

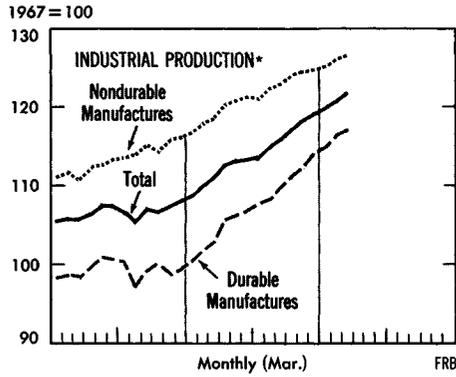

- In first quarter: Inventory investment declined about \$2½ billion
- Federal Government purchases rose \$3 billion, and State and local purchases \$4½ billion

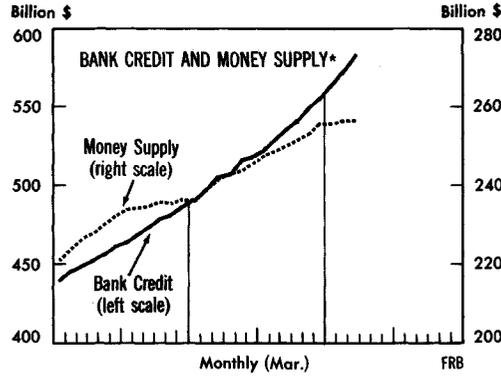

\*Seasonally Adjusted \*\*Seasonally Adjusted at Annual Rates

- In March: Industrial production rose about 0.7 percent
- Bank credit up sharply further, money supply unchanged
- Interest rates and bond yields moved higher

## HISTORICAL STATISTICS

National income and product data for 1929-63 are in *The National Income and Product Accounts of the United States, 1929-1965, Statistical Tables* (available at \$1 from Commerce Department Field Offices or the Superintendent of Documents; see addresses inside front cover). Each July SURVEY contains preliminary data for the latest 2 years and final data for the preceding 2. The July 1972 issue has data for 1968-71. BEA will provide on request a reprint of final data for the years 1964-67. Prior July issues have final data as follows: 1964-65, July 1968; 1965-66, July 1969; 1966-67, July 1970; 1967-68, July 1971.

# Per Capita Personal Income, 1972

# Regional and State Income Gains in 1972

TOTAL personal income in the Nation rose 8¼ percent last year, with gains of 7¼ percent or more in each of the eight regions and in all but two of the States. The exceptions were North Dakota (where income was up 5¼ percent) and New York (where income was up 6½ percent). Nationally, consumer prices rose about 3 percent. The personal income gain in all regions and States and in the District of Columbia exceeded the increase in consumer prices by at least 2½ percentage points, so that the real purchasing power of consumers apparently increased at least moderately.

For the Nation as a whole, per capita personal income (in current dollars) was up 7¼ percent from 1971 to 1972. In all regions and in all but four of the States, per capita income rose at least twice as much as national consumer prices and real per capita income rose significantly.

On a per capita basis, the largest gains in current dollar personal income—ranging from 10 to 11¼ percent—were in Iowa, New Mexico, Wyoming, Tennessee, Arizona, and Mississippi. The smallest per capita income gains—from 5 to 6 percent—were in North Dakota, Hawaii, Maine, and Alaska.

For the most part, these changes reflect the impact of agricultural in-

come. In the first group of States farm income was up substantially, in the second group there were either losses or only small gains. The effects of agriculture are simply a reflection of the volatility of farm production and farm prices. In most nonfarm industries, substantial income gains are associated with an increase in the labor force, much of it stemming from immigration, and hence per capita income rises less than does total income. In farming, sharp changes in net income mainly reflect changes in production and prices and not large changes in labor inputs. Thus these changes in agriculture are transmitted directly into per capita income.

The accompanying table shows State total and per capita personal income annually for each of the last 3 years. The tables in the accompanying article on "Sensitivity of State and Regional Income to National Business Cycles" show total nonfarm personal income quarterly (seasonally adjusted at annual rates) for the period 1960 through 1972. Data back to 1948 for total and non-farm income are available upon request.

NOTE.—The estimates of State personal income were prepared in the Regional Economics Division by Q. Francis Dallavalle, Gordon Lester, Jr., and Steven Johnson. Special programming was done by David Cartwright and Yvonne Collins. The analysis was written by Robert B. Bretzfelder.

# GNP by Major Industry, 1972

IN 1972, practically all industries in the private nonfarm business sector experienced large output gains and a slowdown in the rates of increase in prices, unit costs, and profit margins. Total real GNP increased 6.4 percent, but the increase for private nonfarm business was 7.7 percent, reflecting substantial increases in manufacturing, trade, transportation, and finance. The implicit price deflator for private nonfarm business rose only 1.9 percent, compared with 4.3 percent in 1971; the overall GNP deflator increased 3.0 percent. The 1972 increases in both deflators were the smallest in 6 years.

Preliminary estimates of 1972 gross national product by industry of origin, in current and constant dollars, appear in table 1. Gross product originating in an industry is a measure of the industry's contribution to GNP, i.e., to the Nation's total output of goods and services. An industry's gross product, its value added (or net output), may be

measured as the difference between the value of the industry's total output and the cost of materials and business services purchased by the industry. The same total may also be calculated by summing the industry's payments to the factors of production (employee compensation, profits, etc.) and its nonfactor costs (depreciation, property tax, sales tax, etc.).

### Changes in real net output

The large size of the net output gain recorded for the private nonfarm business sector was principally due to the 9.7 percent increase in *manufacturing output*, which accounted for 36 percent of private nonfarm output last year. The gain in manufacturing was the largest since 1962 and about twice the annual average in 1960-70. The 1972 increase in net output of nondurable goods manufacturing was the strongest since 1955 and was almost as large as the 10 percent increase for durables. Moreover, nondurables net output had

increased 4 percent in 1971, a sizable gain. Particularly large increases were registered in 1972 for foods and beverages, textiles, paper, chemicals, and rubber and plastics products, reflecting the large gains in both personal consumption and industrial demand. Net output of the durable goods industries had increased little in 1971 but grew strongly in 1972, stimulated by a 14 percent increase in business equipment purchases and by sizable inventory accumulation. Auto production, which had reached a record in 1971, increased further in 1972, and the continued boom in housing favored growth in the stone-clay-glass, lumber, and furniture industries.

Net real product in the other goods-producing industries—*agriculture-forestry-fisheries, mining, and contract construction*—declined in 1972. Although current-dollar net output in these industries increased substantially, this was not reflected in the real net output

figures since prices of gross outputs increased more than prices of purchased inputs. The 1972 gain in output of all goods-producing industries was 6.5 percent, about the same as the gain in aggregate real GNP.

After manufacturing, the industry with the largest 1972 output gain was *communication*, an industry noted for its vigorous expansion. Its increase of 8.2 percent was just about equal to its average growth rate in 1960-70.

Sharp growth in net output also occurred in 1972 in the *trade, transportation, and finance-insurance-real estate* industries. Trade output, which accounted for about 21 percent of the private nonfarm sector last year, grew 7.1 percent, considerably above both

the 1971 growth rate and the annual average for 1960-70. Net output of transportation industries increased 6.5 percent, more than three times the 1971 gain and about 1½ times the annual average for 1960-70. The *finance-insurance-real estate* industries registered a net output gain of 6.3 percent, also considerably larger than both the 1971 increase and the 1960-70 average.

The remaining two industry groups—*services, and government and government enterprises*—recorded net output advances in 1972 smaller than the 6.4 percent increase in aggregate GNP. Nevertheless, the 5.2 percent increase in the service industries' output contrasts sharply with the rise of only 1.1 percent in 1971 and the 3.9 percent average for 1960-70. Output growth in 1972 was considerably larger than in 1971 in practically all of the service industries; the largest 1972 increases were in auto repair, amusements (except motion pictures), medical and health services, and business and professional business services (except legal).

Activity of both the Federal and State and local governments increased slightly in 1972, following no change in the aggregate in 1971. The overall 1972 increase in net output was 2.3 percent compared with an annual average of 3.6 percent in 1960-70.

### Price change

Although the price advance for the total economy in 1972 was considerably smaller than in 1971 and more in line with the 1960-70 average, this was not the situation in every industry group (table 3). Price increases in 1972 ranged from a low of 0.8 percent for *manufacturing* to a high of 17.4 percent for *agriculture-forestry-fisheries*.

In the period 1960-70, the deflators for the farm and nonfarm sectors of the private business economy rose at about the same average annual rates, 2.4 and 2.3 percent, respectively. In 1971, however, and even more in 1972, changes in the two deflators diverged sharply. The 1972 advance in the implicit net output deflator for the farm sector was the largest since 1951; for the nonfarm sector, the rise was the smallest since 1966. The imposition of

controls on nonfarm prices, while farm prices were largely exempt, caused farm incomes in current prices to increase relatively more than those in the nonfarm sector. Thus, the price of a unit of gross product rose faster in the farm than in the nonfarm sector.

Other industries in which price increases in 1972 were larger than in 1971 are *electric-gas-sanitary services, and communication*. The price advances in these industries and in *services, transportation, and government* exceeded the 2.5 percent rise in the deflator for the private business economy, and in all of these industries except *transportation* the 1972 price rise was well above the annual average for 1960-70.

An industry's contribution to the increase in the overall price deflator depends not only on the size of its own price advance but also on its weight, i.e., its contribution to total real product. The industries whose deflators registered large increases in 1972 are the relatively minor industries; deflators for industries whose weight in GNP is large, such as manufacturing and trade, show considerably smaller increases in 1972 than in 1971.

### Unit costs and profits

In the private nonfarm business sector, prices (the deflator) rose 1.9 percent, unit labor costs advanced 1.7 percent,

CHART 8

other unit costs increased by 1.4 percent, and profit per unit of output, based upon preliminary estimates, increased by about 0.8 percent. This slight increase in profit margins was preceded by an increase of 5.4 percent in 1971, the first gain since 1966. Thus, increases in compensation and other costs were partially offset by the large output increase and productivity gains.

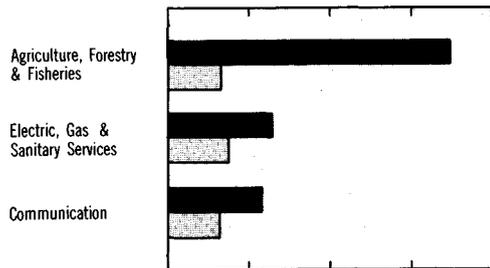

Preliminary 1972 estimates indicate that unit profit margins in the non-farm sector advanced more in the manufacturing industries than in any other industry. The 1972 unit profit margins for the communication, and electric-gas industries approximated those for 1971, while those for trade

CHART 9

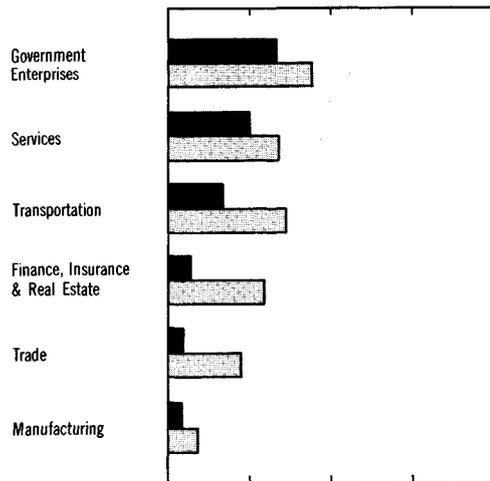

**Increase in Prices**

● Price increase larger in 1972 than in 1971

● Price increase smaller in 1972 than in 1971

and finance-insurance-real estate declined.

The 1972 rise in unit labor costs was the smallest since 1965. This deceleration stemmed principally from declining rates of increase in such large industries as manufacturing, trade, and finance-insurance-real estate. However, there were marked increases in unit labor costs in 1972 in two industries, communication and electric-gas-sanitary services. Both industries have been generally noted for having relatively small increases in unit labor costs, but in 1972 their output advances were considerably smaller than their increases in compensation. Output increased 3.4 percent for the utilities and 8.2 percent for communication, while compensation in these industries increased about 11 and 18 percent, respectively. On the other hand, farm unit labor cost increased 9.9 percent, the largest advance in more than a decade. While the compensation component for farm gross product is relatively smaller than for any other industry, the 1972 prelim-

inary estimates also show large gains in proprietor's income.

The 1972 increase in unit labor costs in manufacturing was only 0.1 percent while the rise in nonmanufacturing industries was 2.6 percent.

**Percent Change in Unit Labor Costs**

	1960-70 <sup>1</sup>	1971	1972
Farm.....	1.7	1.5	9.9

# Sensitivity of State and Regional Income to National Business Cycles

NONFARM personal income in the United States increased at an average annual rate of 6½ percent over the 88 quarters from the fourth quarter 1948 to the fourth quarter 1970.<sup>1</sup> However, the rate of change in nonfarm income was considerably different in periods of expansion relative to periods of recession.

During the 71 postwar quarters of business cycle expansion (completed expansions), nonfarm personal income nationally increased at an average annual rate of 7.6 percent with individual quarterly changes ranging from an increase of 28 percent to a decline of nearly 1 percent. During the 17 quarters of recession (5 completed recessions), nonfarm personal income increased at an average annual rate of 1.9 percent, with quarterly changes ranging from a decline of 3 percent to a gain of 11 percent. The difference between the expansion and recession averages is 5.8 percentage points, which is called the "cyclical swing," in this article. The expansions and recessions are timed by peaks and troughs in real quarterly gross national product (GNP),<sup>2</sup> because the article deals with quarterly personal income which is an integral component of the national

\* \* \* \* \*

NOTE.—The estimates of State personal income were prepared in the Regional Economics Division by Q. Francis Dallavalle, Gordon Lester, Jr., and Steven Johnson. Special programing was done by David Cartwright and Yvonne Collins. The analysis was written by Robert B. Bretzfelder.

1. Farm income is excluded from the analysis in this article because cyclical changes in farm income have been masked by changes due mainly to the weather and other factors not related to business cycles. Nonfarm income is defined as total personal income less farm proprietors' income and farm wage and salary payments. The study covers the nine completed postwar business cycle expansions and recessions. It ends with the fourth quarter of 1970, thereby excluding the current expansion because it has not been completed. Tables 4 and 5 show quarterly (seasonally adjusted at annual rates) State and region data for total personal income and nonfarm personal income from 1960 to 1972. Data back to 1948 are available upon request.

income and product accounts. In nearly all cases, these turning points coincide with or differ by only one quarter from the business cycle turning points established by the National Bureau of Economic Research; only one differs by as much as two quarters.

The cyclical swing was positive in all regions and in 48 States, but the size of the swing varied greatly, from more than 11 percentage points in Michigan and Indiana to less than 1½ percentage

points in Idaho, Nebraska, and Montana; North and South Dakota had small negative swings.

This article examines the effects of the national business cycle on State and regional nonfarm personal income behavior, summarized in terms of the cyclical swing. No attempt is made to identify State and regional business cycles, because the measures of production necessary for such a calculation do not exist.

## Cyclical Sensitivity of the States

TABLE 1 shows the States classified into three groups: (1) The 11 States where the cyclical swing was largest, averaging 8.4 percentage points; (2) the 21 States where the cyclical swing ranged from slightly above the national average of 5.8 points to moderately below it, averaging 4.7 percentage points; and (3) the 18 States where the cyclical swing was smallest, averaging 2.8 percentage points.

A State's cyclical sensitivity is determined primarily by income behavior during recessions. During expansions, the average rates of income gain in the most and the least sensitive groups differ by only 0.5 percentage points, but during recessions the average rates differ by 5.0 percentage points. Table 1 also shows that there is little relationship between the overall postwar growth rate of nonfarm income and the degree of cyclical sensitivity.

### Industrial composition

It is clear from the data in table 2 that the differential effect of the national business cycle on the individual States was mainly a product of State differences in industrial composition. States in which a large share of nonfarm income consists of manufacturing payrolls, especially durable goods manufacturing, and of mining payrolls, especially coal mining, were the States most sensitive to the cycle. Nationally,

2. The peaks and troughs are as follows:

Real GNP peak	Real GNP trough
1948-IV	1949-II
1953-II	1954-II
1957-III	1958-I
1960-I	1961-I
1969-III	1970-IV

Because the current expansion is still in progress, it is not included in the computations. To do so would distort the result because the early phase of an expansion differs from the later phases in varying degrees and the relationship for the current expansion is unknown at this time.

wage and salary payments from durable goods manufacturing and coal mining<sup>3</sup> had the largest cyclical swing among major income components, and the cyclical swing in manufacturing and mining payrolls was greater in the cyclically sensitive States than it was nationally. In the 11 most sensitive States, nonfarm income excluding manufacturing and mining payrolls had a cyclical swing of only 3.2 percentage points, compared with a swing of 8.4 points for total nonfarm income. For the Nation, the swings were 2.7 points excluding manufacturing and mining and 5.8 points for total nonfarm income.

Eight of the nine States with the largest cyclical swing in total nonfarm income also had the largest swings in manufacturing payrolls; the exception is South Carolina, where, in addition to manufacturing, swings in construction and military payrolls were major contributors to the overall cyclical swing. The situation in Alaska is rather curious: Alaska had the Nation's largest swing in manufacturing payrolls, but manufacturing is not important in Alaska's economy and thus contributed little to that State's high cyclical sensitivity. The major factor in the large cyclical swing in total nonfarm income in Alaska was military payrolls, which are very important in the State's economy and which registered an above-average swing there.

In all 18 of the cyclically insensitive States, the swing in manufacturing payrolls was below the national average.

Coal mining payrolls comprise at least 0.5 percent of nonfarm income in three of the 11 most sensitive States, and showed a greater cyclical swing in those States than they did nationally. The impact of mining payrolls on the swing in total nonfarm income was heaviest in West Virginia, Pennsylvania, and Alabama.

Unemployment compensation payments offset some of the impact of the swing in manufacturing and mining payrolls. For the Nation as a whole,

3. State estimates of durable goods manufacturing and coal mining payrolls are not available on a quarterly basis but estimates of total manufacturing and total mining payrolls are. Durable goods manufacturing and coal mining are the most cyclically volatile components of their industrial group. For these reasons, in the discussion of the importance of the various industries in total nonfarm income, durable goods manufacturing and coal mining are used, but in the discussion of cyclical swing, the manufacturing and mining totals are used.

unemployment compensation increased at an average annual rate of 90 percent during recessions and declined at a rate of 6 percent during expansions—a negative swing of 96 percentage points. As table 2 shows, the national cyclical swing in nonfarm income excluding unemployment compensation was 6.3 percentage points, compared with the swing of 5.8 points in total nonfarm income. The largest gains in unemployment compensation during recessions were in the cyclically-sensitive States. In the sensitive group, the cyclical swing in nonfarm income excluding unemployment compensation was 9.2 percentage points, compared with 8.4 points for total nonfarm income. The comparable figures for the insensitive group of States are 3.1 and 2.8 percentage points.

#### *Consistency of cyclical behavior*

Individual States in both the sensitive and the insensitive groups show a strong tendency to react in the same way in each of the four postwar cycles.

Thus, the averages across the four cycles tend to be representative of postwar cyclical behavior generally rather than a reflection of one or two overriding experiences.

Table 3 shows 44 individual cyclical swings in the cyclically-sensitive States (11 States and four postwar swings). All but seven of these 44 swings were larger than the relevant national average. All cyclical swings in the five most sensitive States (Michigan, Indiana, Ohio, South Carolina, and Alabama) and in Pennsylvania and West Virginia were larger than the relevant national average. The swing in Illinois was greater than the national average in three of the four cycles, and the swings in the other three States of the sensitive group—Alaska, Connecticut, and Georgia—were above-average twice. Table 3 shows 72 individual cyclical swings in the cyclically-insensitive States (18 States and four postwar swings). All but 10 of these 72 swings were less than the relevant national average.

## Regional Patterns

REGIONALLY, the impact of the business cycle is concentrated in the Great Lakes, where the cyclical swing was more than half again as large as the national average, and in the Southeast, where it approximated the national average. The cyclical swings in the Plains and Rocky Mountain regions were roughly half the national average, and those in the other four regions—Mideast, New England, Far West, and Southwest—were moderately below the average.

#### *Great Lakes*

On average, nonfarm personal income in the Great Lakes rose at an annual rate of 7¼ percent during expansions and declined at a rate of a little more than 1¼ percent in recessions, for a cyclical swing of 9 percentage points (table 1). The Great Lakes is the only region to show an actual decline, on average, during recessions.

As table 2 shows, manufacturing is

the key to the cyclical sensitivity of the Great Lakes. Manufacturing payrolls are a more important income source in that region than elsewhere, and the cyclical swing in manufacturing payrolls is much sharper there than elsewhere. In reaction to the swings in manufacturing, most other major income components also showed somewhat larger-than-average swings. These include payrolls in construction, trade, and the transportation-communications-public utilities group, and nonfarm proprietors' income.

The cyclical swing in the Great Lakes would have been even larger were it not for the counter-cyclical effects of unemployment compensation payments which rose at an average annual rate of 153 percent in the Great Lakes during recessions, compared with a 90 percent rate nationwide.

Income growth in the Great Lakes during three of the four postwar expansions was close to, but somewhat

slower than, the nationwide average. In the expansion from mid-1949 to mid-1953, however, with demand for both military and civilian durable goods rising sharply during the Korean War, income in the region increased at an annual rate of nearly 10 percent, compared to the national average of 9 percent. The most recent completed expansion (1961 to 1969) also saw sharply rising demand for civilian and military durables, and the average annual income gain in the region (7.4 percent) was only 0.2 percentage point less than that in the Nation.

Every State in the Great Lakes region except Wisconsin had a postwar cyclical swing a good deal larger than the U.S. average. The swing in Wisconsin was fairly close to the average, mainly because manufacturing payrolls there swung only as much as they did nationally. Also, durable goods manufacturing payrolls are a smaller share of nonfarm income in Wisconsin than in the region as a whole.

#### *Southeast*

The cyclical swing in the Southeast was 5.7 percentage points. This is little different from the U.S. average, but the average rate of income advance was greater in the region than in the Nation during both expansions and recessions. Wages and salaries in mining swung more in the region (12.8 percentage points) than in the Nation (9.7 percentage points), and coal mining has a heavier weight in the region's income than in the Nation's (table 2). Construction payrolls also swung more in the region than in the Nation. However, the swing in manufacturing payrolls (13.3 points) was below the national average (15.4 points). This primarily reflects the predominance of nondurables in the region's manufacturing.

Four of the 12 States in the Southeast had average cyclical swings well above the U.S. average; in six States the swings were average to a little below average; in two States, they were well below average. The States in which coal mining and manufacturing are most important show the largest swings, and the smaller, more agricultural States show below-average swings.

#### *Mideast, New England, Far West, and Southwest*

The cyclical swings in the Mideast and New England (5.1 percentage points each), Far West (4.6 percentage points), and Southwest (4.3 percentage points) were all moderately below the U.S. average of 5.8 percentage points. In all four regions, the swings in nearly all major industries were likewise a little below the national average. The exceptions are in the Far West and the Southwest, where the swings in construction and trade were somewhat larger.

The underlying income trends in the two northeastern regions differ from those in the southwestern and western areas. For the postwar period as a whole, average annual income growth in the Mideast (5.8 percent) and New England (6.1 percent) was somewhat below the national average (6.5 percent). In both regions, income growth during expansions was a little below the national average but income gains were well maintained during recessions. In both the Far West and Southwest, the average annual postwar income growth was 7.4 percent, stronger than in the Nation, and the average gains in both expansions and recessions were well above the national average.

Of the 19 States comprising these four regions, only two—Pennsylvania and Connecticut—had average swings well above the U.S. average. Thirteen of the States had swings that are about average to somewhat below average, and the other four had swings well below the average.

Pennsylvania's cyclical sensitivity reflects the presence of both durable goods manufacturing and coal mining. In Connecticut, the sensitivity is due mostly to the State's large and cyclically very sensitive durable goods manufacturing industry.

#### *Plains and Rocky Mountain*

The average cyclical swings were very small in the Plains (3.2 percentage points) and Rocky Mountain (2.2 percentage points) regions. The rate of income gain in both regions was somewhat below average during national expansions but was very well maintained

during national recessions. The swings in nearly all major nonfarm income components were less in these two regions than in the Nation. Payrolls in construction actually expanded somewhat faster in recession than in expansions in the two regions—a negative swing—and the swings in nonfarm proprietors' income were mild. The counter-cyclical change in unemployment compensation payments in both regions was also well below national average.

Nearly all of the 12 States in these regions have small and heavily agricultural economies, and all but one of them had a cyclical swing well below average. Missouri, the exception, has the largest economy of the group, is the most heavily industrialized, and one of the three least agricultural; however, even Missouri's cyclical swing was a little below the U.S. average.

The anomaly of a somewhat faster growth (on average) in nonfarm income during recessions than during expansions in North and South Dakota—negative cyclical swings—is largely explained by developments in construction. On average, construction payrolls expanded much faster in both States during recessions than during expansions, and this alone accounted directly for nearly all of the negative cyclical swings. Excluding construction, nonfarm income went up about as fast in recessions as in expansions in North Dakota (a zero cyclical swing) while South Dakota had a cyclical swing of about 0.5 percentage point. The rapid expansion in construction during periods of recession reflects the impact of military and farm construction, mainly during the early postwar recessions.

Nonfarm income has usually been better maintained in both North and South Dakota than nationally during recessions, but the differentials were greatest during the first postwar recession. During expansions, income growth in the two States has generally been below the national average, but the differentials were moderate. Thus, much of the average negative cyclical swing in the two States is traceable to the large income gains that occurred in the first (1948–49) recession.

Table 1.—Behavior of Nonfarm Personal Income During Postwar Business Cycles

# The Composition of Value Added in the 1963 Input-Output Study

THIS article presents estimates of the composition of value added by industry in 1963, supplementing the data on total value added by industry that were published in the initial article on the input-output study for 1963.<sup>1</sup> Also presented are some illustrations of how these new and more detailed data can be used to estimate the impact that changes in the level or composition of GNP may have on the aggregate levels and industrial composition of the value-added components.

As defined by BEA, an industry's value added is the measure of its contribution to GNP, i.e., to the Nation's output of goods and services.<sup>2</sup> It can be measured as the difference between the value of the industry's total output and the cost of the goods and services it purchases from other industries; or, it can be calculated by summing the industry's payments to the factors of production (employee compensation, profits, etc.) and its nonfactor costs (depreciation, property and sales taxes, etc.). This article shows value added divided into 3 components—employee compensation, indirect busi-

ness taxes, and property-type income (gross of depreciation)—for each of the 78 producing and 4 special industries of the 1963 input-output table.

These estimates were developed from data compiled for the more aggregative series on gross product originating (GPO) by industry published annually by BEA. The value-added components have been reallocated to match the industrial classification and the concepts and conventions relating to definitions of output used in the 1963 I-O study.<sup>3</sup> A reconciliation of these newly developed estimates of industry value added for the year 1963 with the GPO estimates for 1963 is provided in an appendix to this article so that GPO data and national income by industry data available for other years can be adapted for use in input-output analysis.

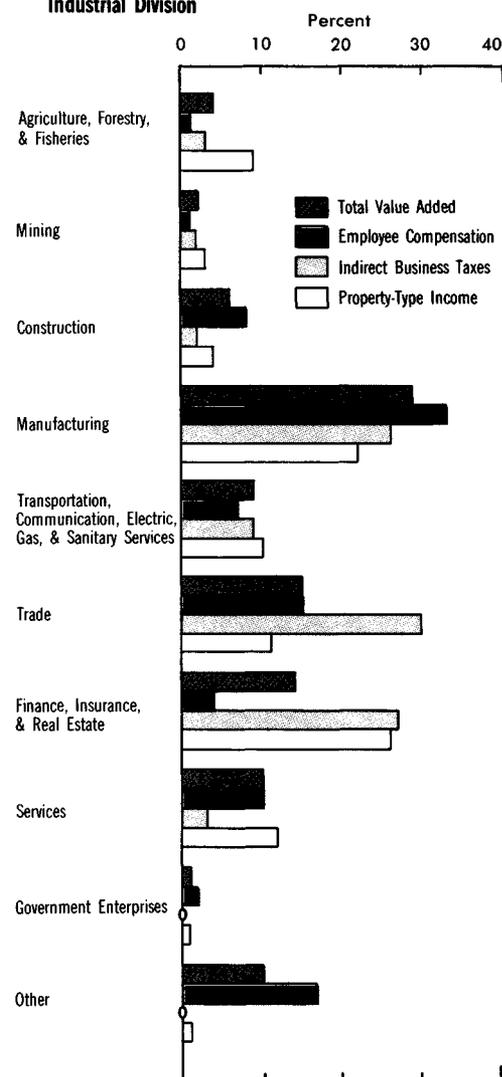

The additional detail on components of value added permit an interesting application of input-output analysis. The detail is used, in conjunction with data on imports from the original 1963 I-O study, to calculate the amount of primary inputs (value added and imports) that would be generated directly and indirectly by the sale of one unit (one dollar or one million dollars' worth) of each industry's output to final demand. Although the principal focus of this article is on the additional detail on the components of value added, the use of these data within the I-O framework to show the relationship between an industry's sale to final demand and its direct and indirect demand for primary inputs requires the inclusion of imports for completeness. The estimates presented

in this article of the amounts of the primary inputs generated by an industry's sales to final demand show

CHART 10

## Industrial Composition of Value Added, 1963

Percentage of Total Value Added, and of its Components, Originating in Each Major Industrial Division

NOTE.—The statistical work to allocate the aggregate amounts of the value added components to I-O industries, and to reconcile the I-O detail with the estimates of gross product originating by industry was directed by William M. Eisenberg, formerly with BEA and now with the Bureau of Labor Statistics.

1. "Input-Output Structure of the U.S. Economy: 1963," SURVEY, November 1969. A single value added figure is shown there for each of the producing industries (I-O 1-79) and four special industries (I-O 84-87).

2. This is somewhat different from the definition used by the Bureau of the Census to calculate "value added by manufacture" as published in the *Census of Manufactures* and the *Annual Survey of Manufactures*. Census defines value added as the difference between the value of production (value of shipments plus miscellaneous receipts adjusted for changes in inventories of goods in process and finished goods) and the cost of materials, supplies, containers, fuels, purchases of electricity, and contract work put into production. The most important conceptual differences are that BEA's measure adds the sales and excise taxes collected in the industry but subtracts the cost of services supplied by other industries.

3. Additional comments on the methodology used to allocate the components of value added among the industries in mining and manufacturing are found in the technical note at the end of this article.

that its composition varies widely among industries and therefore, different patterns of final demand will have associated with them different proportions of the value-added components.

Three uses for the new value-added detail are illustrated in this article.<sup>4</sup> (1) It is used to measure the amounts of the value-added components and of imports generated by each major GNP component in 1963. (2) It is

used to measure the impacts that \$1 billion of final demand spent in alternative ways can have on the aggregate amount of employee compensation. This type of analysis can be carried out for other components of value added as well. (3) It is used (with certain rather restrictive assumptions) to trace the impact that changes in cost in any one industry can have on the prices of other industries' products.

Imputations in the national accounts for the value of banking services provided without explicit charges and for the rental value of owner-occupied housing have a strong influence on estimates of profits and of rental income of persons and, therefore, on the property income component of value added in this industry division. Manufacturing's share of property-type income was 22 percent—smaller than its share of value added as a whole. Agriculture accounted for 9 percent of property-type income, double its share of value added as a whole, reflecting the importance of net earnings of farm proprietors in this sector of the economy.

## Composition of Value Added

### *Industrial origin of value added and its components*

Table 1 shows total value added in each I-O industry, disaggregated into three components: employee compensation, indirect business taxes, and property-type income. The industry detail in table 1 is that used in the 85-order I-O tables published in the November 1969 article. Total output (column 1) and value added (column 2) are the same as published in table 1 of that article. The I-O value-added components relate to the detail published in the national income and product (NIP) accounts as follows:

I-O Value-Added Components	NIP Accounts
Employee compensation	Employee compensation
Indirect business taxes	Indirect business tax and nontax liability
Property-type income	Proprietors' income Rental income of persons Corporate profits and inventory valuation adjustment Net interest Business transfer payments Surplus of government enterprises less subsidies Capital consumption allowances

It was not feasible to allocate property-type income for 1963 in greater detail among the I-O industries. Some components shown in the NIP

accounts, however, affect just a few I-O industries. Rental income of persons occurs only in the real estate and rental industry (I-O 71), the surplus of government enterprises, in Federal and State and local enterprises (I-O 78, 79), and the inventory valuation adjustment is shown separately in I-O 87.

Chart 10 shows the percentages of total value added, and of each of its components, originating in each major industry division in 1963. It is based on the data in columns 2-5 of table 1. Manufacturing was the main source of value added, contributing 29 percent of the total; it was followed by trade with 15 percent, and by finance-insurance-real estate with 14 percent.

Manufacturing was an even more important source of employee compensation than of value added as a whole, accounting for 33 percent. The next most important source, with 17 percent, was the "other" industries (general government, households, and the rest of the world).

Trade accounted for the largest share, 30 percent, of indirect business taxes, mainly reflecting sales taxes collected in trade channels. Finance-insurance-real estate and manufacturing followed closely with 27 percent and 26 percent, respectively. Property taxes on rental property and on owner-occupied housing are the main element in indirect business taxes originating in finance-insurance-real estate, and excise taxes are the main element in manufacturing.

Finance-insurance-real estate was the main source of property-type income, accounting for 27 percent of the total.

### *Value added components*

For all industries combined, employee compensation accounted for 59 percent of value added in 1963, property-type income for 33 percent, and indirect business taxes for 9 percent. Columns 6-9 of table 1 show the composition of each industry's value added. The composition is plotted in chart 11, where the industries are ranked according to the share of employee compensation in value added. The employee compensation share of value added in Federal Government enterprises (I-O 78) is slightly over 100 percent because deficits, mainly in the post office, more than offset earnings of other Federal enterprises. From this point the compensation share ranges down to slightly over 2 percent in the real estate and rental industry (I-O 71) whose low share is due mainly to definitions and conventions used in the I-O study; compensation for maintenance construction done on force account is redefined out of the industry in the I-O accounts (see technical note) and imputations for the rental value of owner-occupied housing, already mentioned, are included.

Employee compensation was less than half of value added in only 15 of the I-O industries. Two types of industry are in this group. The first consists of industries where self-employment is important, which boosts property-type income relative to employee compensation. This type includes farms (I-O 1 and 2), forestry and fisheries (I-O 3), and services,

4. It is important to point out certain dangers in analyses that depend on the assumption of stability (over time and through a range of output levels) of the composition of each industry's value added. For example, corporate profits may vary widely from year to year and indirect business taxes are affected by state and local legislation establishing new and revised sales and property taxes. Therefore, the data presented here are most useful for years close to 1963; for other years, the data should be adjusted to reflect known changes. Detailed value-added data for 1967 are being prepared in connection with the 1967 I-O study, which is due to be released later this year.

Table 1.—Components of Value Added for Industries in the Input-Output Table, 1963

Industry No.	Industry <sup>1</sup>	Total output	Value added	Em- ployee com- pen- sa- tion	Indirect busi- ness taxes	Prop- erty type income	Total	Em- ployee com- pen- sa- tion	Indirect busi- ness taxes	Prop- erty type income	Value added	Em- ployee com- pen- sa- tion	Indirect busi- ness taxes	Prop- erty type income

such as auto repair (I-O 75). The second type consists of industries with heavy investments in property or natural resources. They are the highly automated and mechanized industries such as those producing chemicals (I-O 27), drugs and cleaning and toilet preparations (I-O 28), and tobacco products (I-O 15); or utilities with heavy investment in plant and equipment, e.g., electric, gas, water, and sanitary services (I-O 68) and communications (I-O 66); or extractive industries, e.g., iron mining (I-O 5) and petroleum and natural gas (I-O 8).

The indirect business tax share of value added is between 2 and 5 percent in most industries. It is a bit higher in industries where investment in property

is significant, such as agriculture, mining, and real estate rentals, reflecting the property tax. The share of indirect business taxes in value added is also relatively high in industries that make significant payments of excise and special sales taxes, such as tobacco products (I-O 15), petroleum products (I-O 31), communications (I-O 66), alcoholic beverages (part of food processing, I-O 14), motor vehicles (I-O 59), amusements (I-O 76), rubber tires (part of rubber and miscellaneous plastics, I-O 32), and household appliances (I-O 54).<sup>5</sup> The share is relatively high in finance and insurance (I-O 70) because of the stock transfer tax, and in trade (I-O 69) because of general sales taxes.

## Value Added and Output

### *Value added related to industry's total output*

Columns 10 through 13 of table 1 show the ratio of each industry's value added, and its components, to the industry's total output. The ratio of value added to output varies from a high of 85 percent in communications (I-O 66) to a low of 18 percent in miscellaneous textiles and floor covering (I-O 17).<sup>6</sup>

The higher an industry's ratio of value added to output, the less input of goods and services it requires from other industries, and the less impact a change

in demand for its output will have on other industries.

The industries with the highest ratios are mainly service-type industries—communications (I-O 66), real estate and rentals (I-O 71), Federal Government enterprises (I-O 78), trade (I-O 69), etc.—or extractive industries—coal mining (I-O 7), crude petroleum and natural gas (I-O 8). Of the 23 industries in which value added is 50 percent or more of output, only 3 are manufacturing industries: optical, ophthalmic, and photographic equipment (I-O 63), glass and glass products (I-O 35), and office, computing and accounting machines (I-O 51). The industries with the lowest ratios of value added to output are mainly the highly mechanized manufacturing industries that process large volumes of raw materials without much labor, or that assemble highly fabricated and therefore costly components. Examples

of the first type are petroleum refining (I-O 31), textile manufacturing (I-O 16, 17), and primary nonferrous metals (I-O 38). Manufacturers of farm machinery and equipment (I-O 44) and of motor vehicles and equipment (I-O 59) are examples of the latter type.

### *Primary inputs per dollar of industry's sale to final demand*

Input-output analysis establishes the relationship between the value of products delivered to final demand (GNP) and the primary inputs required directly and indirectly in order to supply them. Primary inputs are those inputs that are not the output of other producing industries in the system; they consist of the components of value added and imported goods and services. This section shows the value-added and import content of \$1.00 of each industry's final product.

To deliver a unit of its product to final demand, each industry directly and indirectly consumes the output of the other producing industries in combination with its own primary inputs of value added and imports. The output provided by its supplying industries can in turn be disaggregated into the primary inputs of these industries and output supplied by their suppliers. This analysis can be continued in turn through the full chain of production so that each industry's output is fully decomposed into its own primary inputs and its consumption of the primary inputs of its direct and indirect suppliers. In this way the requirements for an industry to deliver a unit of its product to final demand no longer consists of the outputs of its direct and indirect suppliers but of the primary inputs that have been absorbed by itself and its suppliers.

One way to calculate these primary input requirements for an industry is to multiply the coefficients from its column

5. Many of these taxes have been lifted or modified since 1963.

6. It should be noted that these ratios are affected by the conventions that have been adopted for constructing the national income and product accounts and the input-output accounts, such as: the inclusion of imputations for non-market transactions in the output of industries, the transfer treatment of secondary production and imports, the definition of output in wholesale and retail trade to reflect gross margins on the sale of merchandise, etc. These and other conventions which affect the ratios of value added to output are discussed in the technical note at the end of this article.

#### Footnotes for Table 1.

1. The dummy industries, business travel and entertainment (I-O 81), office supplies (I-O 82), and scrap, used, and secondhand goods (I-O 83) have no value added and are omitted from this list.

2. The ratios of value added and its components to total output in Federal Government enterprises (I-O 78) agree with the direct requirements coefficients published in the November 1969 SURVEY. They were modified to exclude the operations of the Commodity Credit Corporation. The nature of the Corporation's activities can vary significantly from year to year and, therefore, would introduce an element of instability into the coefficients. The components of value added relating to CCC operations which have been subtracted from the figures in columns 2, 4, and 5 for I-O 78 (and for the Government enterprise subtotal) before calculating

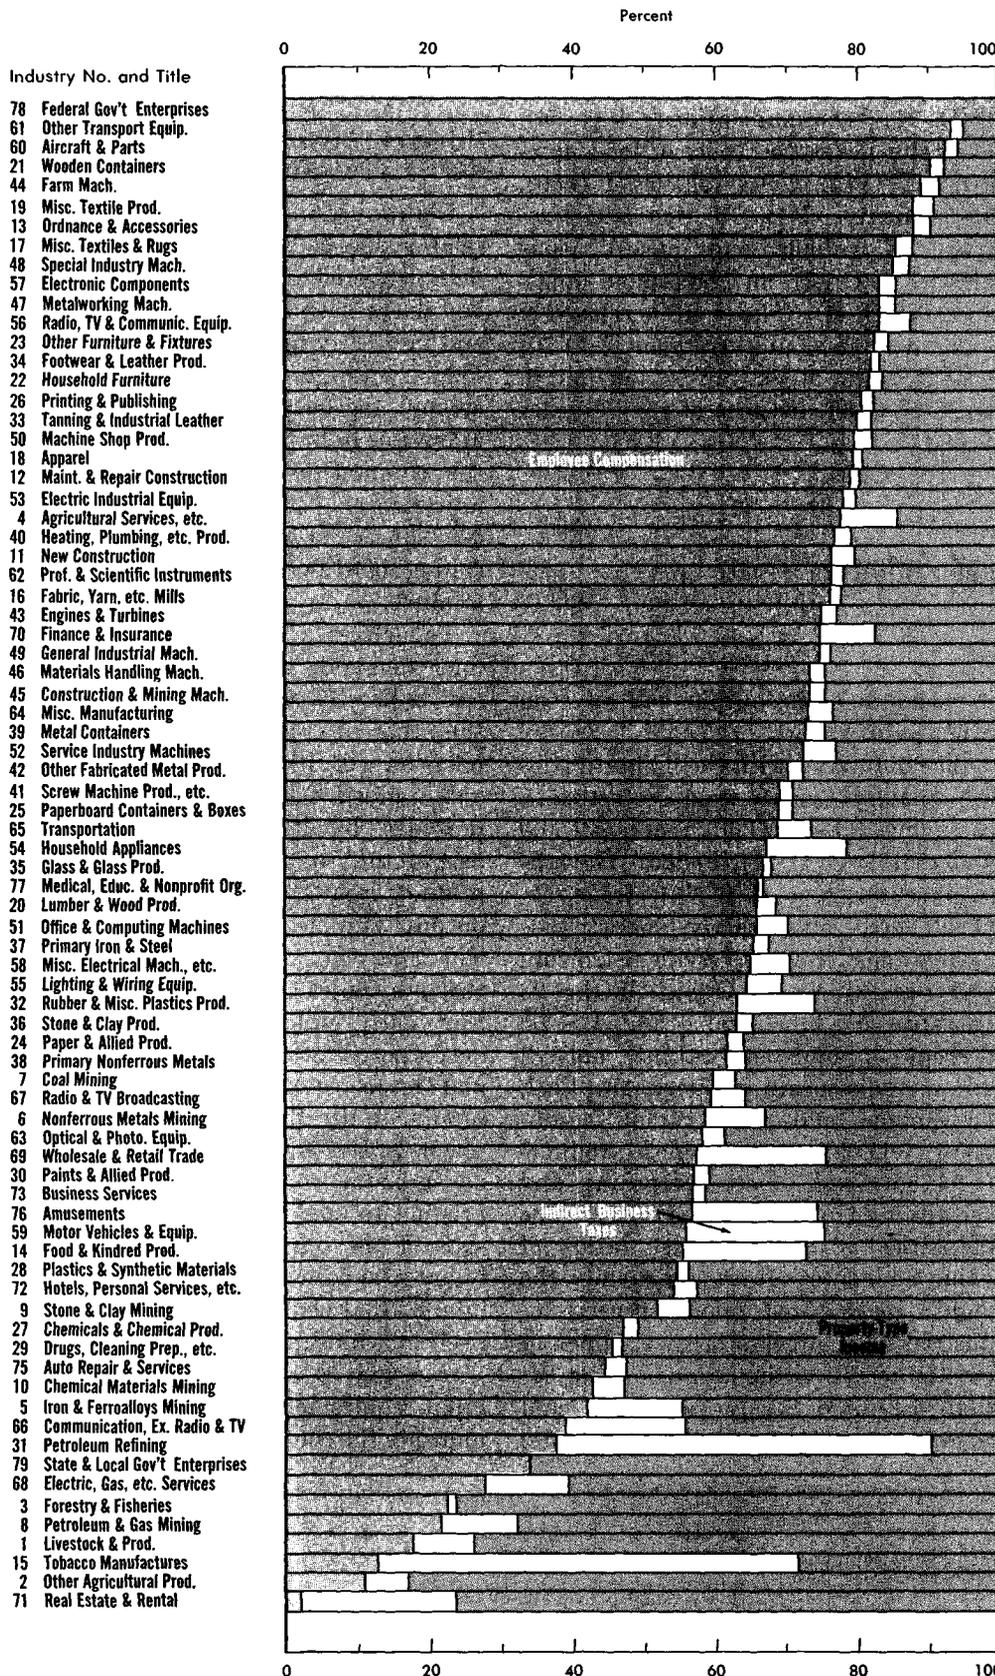

the ratios in columns 10, 12, and 13 are as follows (in \$millions): total value added, \$-1,531; indirect business taxes, \$69; profit-type income, \$-1,600.

3. Total output of the rest of the world industry (I-O 85) reflects U.S. earnings from foreign investments and a small amount of compensation paid by foreign organizations to U.S. citizens. Earnings by foreigners from their investments in the U.S. are treated in the I-O accounts as a transferred import. Thus, value added in the rest of the world industry reflects net factor income received in the U.S. Since receipts and payments on foreign investment accounts would be determined independently in other years, the 1963 ratio would have no applicability to other years.

NOTE.—Details may not add to totals because of rounding. Source: U.S. Department of Commerce, Bureau of Economic Analysis.

CHART 11

**Composition of Value Added:  
Industries Ranked by the Share of Employee Compensation in Value Added**

in the total requirements table in the input-output study (table 3 in the November 1969 article) by the ratio of value added to output for the corresponding producing industry shown in columns 10-13 of table 1 (with a ratio of 1.0 applied to imports). When the coefficients in any given column of the total requirements table are multiplied by the ratios of total value added to output for the appropriate producing industries, the derived ratios will represent the amounts of value added and imports required directly and indirectly to deliver \$1.00 of output to final demand (GNP). The derived ratios in each column will sum to 1.0; that is, \$1.00 of sales to final demand generates \$1.00 of value added.<sup>7</sup> This demonstrates that the value of an industry's final output is the sum of the value added by that industry and the value that has been added by all the other industries (including imports) that supplied inputs directly and indirectly. If the total requirements coefficients for a given industry are multiplied by the ratios of the separate value-added components to output, one can calculate the amounts of the separate primary inputs (the three value-added components plus imports) that directly and indirectly make up \$1.00 of the given industry's final output. Table 2 shows the value-added and import content per dollar of each industry's final product in 1963.

It can be seen from table 2 that the composition of the primary inputs per dollar of final output varies widely among industries. For instance, \$1.00 spent on tobacco products (I-O 15) generates 21 cents of employee compensation, but if spent on aircraft and parts (I-O 60) it generates 78 cents of employee compensation. The amount of indirect business taxes per dollar of final output is a fairly uniform 4 to 5 cents except in industries such as tobacco (I-O 15) and petroleum (I-O 31) whose products are subject to special excise taxes. The amount of property-type income per dollar of final output ranges from 7 cents for Federal Government enterprises (I-O 78) to 66 cents

7. Because of the treatment of scrap and byproducts in the I-O system this statement requires a slight qualification, discussed in a technical note at the end of the article.

for agricultural crops (I-O 2) and the real estate and rental industry (I-O 71). The amount of imports per dollar of final output is generally less than 5 cents except in industries in which imports are a significant part of total supply, such as forestry and fishery products (I-O 3) and iron mining (I-O 5).

## Value-Added and Import Content of GNP Components, 1963

THE estimated primary inputs per dollar of industry sales to final demand (table 2) were used to calculate the amount of employee compensation, indirect business taxes, property-type income, and imports generated in 1963 by each major GNP component: personal consumption expenditures, gross private domestic investment, gross exports, Federal Government purchases, State and local government purchases. Sales by each I-O industry to each of the major GNP components in 1963 are shown in table 1 of the November 1969 SURVEY article. These data on the industrial composition of the GNP components combined with the data presented here on primary inputs required per dollar of each industry's sales to final demand yield the estimates shown in table 3 of the amounts of employee compensation, indirect business taxes, property-type income, and imports generated by each GNP component.<sup>8</sup>

In calculating GNP, exports are entered net of imports. In input-output analysis, however, it is gross exports that are of interest when one wants to trace the direct and indirect impacts of final demand on the producing industries. In table 3 of this article, the export column of final demand reflects gross exports, and the accounts are balanced by showing gross imports as a

8. The value-added content of GNP components can also be calculated using the total requirements table (table 3 in the 1969 article) to generate the total output required directly and indirectly from each industry and then applying the ratios of value added to output from table 1 of this article to derive the primary inputs. This calculation will also yield the industrial composition of the value-added components which cannot be obtained from the information in table 2. BEA has developed a set of four special value-added coefficient matrices, one for total value added and each of its components, that permit the calculation to be made in one step. They are described in the technical note at the end of the article and their use is illustrated in the following section.

Table 2.—Primary Inputs Per Dollar of Industry's Sale to Final Demand

[Cents]						
Industry No.	Industry	Employee compensation	Indirect business taxes	Property-type income	Imports	Total
1	Livestock & livestock products.....	29.2	08.9	58.5	03.5	100.0

primary input. In this way it is possible to show the direct and indirect import content of the various categories of final demand.

The top panel of table 3 shows the dollar amounts of the primary inputs generated by each major component of final demand. For instance, personal consumption expenditures (PCE) generated \$175 billion of employee compensation in 1963, \$43 billion of indirect business taxes, \$141 billion of profit-type income, and \$17 billion of imports.

The second panel of table 3 shows the distribution of each primary input among the components of final demand. Personal consumption expenditures are the largest final demand component, accounting for 60.9 percent of gross final demand. However, the shares of the primary inputs generated by personal consumption expenditures range as low as 51.3 percent for employee compensation and as high as 78.3 percent for indirect business taxes.

Conversely, the impact of gross private domestic investment is heaviest on employee compensation and least on indirect business taxes: gross private domestic investment accounts for 13.9 percent of gross final demand but it generates 15.7 percent of total employee compensation and only 10.3 percent of total indirect business taxes.

The third panel of table 3 shows the composition of each component of final demand in terms of primary inputs. Differences in these patterns of primary inputs result from the differing industrial composition of the expenditures for final products that make up the components. The composition of total final demand in 1963 was 55 percent employee compensation, 9 percent indirect business taxes, 32 percent property-type income, and 4 percent imports. The composition of PCE in terms of primary inputs was markedly different, with employee compensation accounting for 47 percent and property-type income for 37 percent. This difference is related to the fact that large amounts of consumer expenditures are for output of the food (I-O 14), trade (I-O 69), and real estate and rental (I-O 71) industries, whose value-added content (as shown in table 2) is characterized by relatively

small amounts of employee compensation and large amounts of property-type income; and to the fact that many sales and excise taxes are aimed at products and services consumed by persons.

The rather large share (62.5 percent) of employee compensation in the primary inputs generated by gross private domestic investment reflects the fact that the new construction industry (I-O 11), whose value added content consists heavily of employee compensation, makes up over 50 percent of this final demand category.

Income from foreign investments (I-O 85), and from the sales of agricultural crops (I-O 2), food and kindred products (I-O 14), and chemicals (I-O 27) were important export receipts in 1963. These industries all have higher-than-average shares of property-type income in their value added; therefore, property-type income has an above average share

(44 percent) in the primary input content of exports.

Compensation of Government employees is a significant part of the purchases of both Federal and State-local governments, and thus is the dominant element in the primary inputs generated by government purchases.

Imports constitute 4.3 percent of primary inputs to final demand as a whole, and there is a similar import share in the primary inputs generated by personal consumption expenditures, private investment, and exports. Imports are a very small share (1.6 percent) of the primary inputs generated by State-local government purchases, but are 6.3 percent of the primary inputs generated by Federal Government purchases. Expenditures to maintain establishments overseas were largely responsible.

industries. Only three commodity-producing industries appear among the 10 most affected by the "PCE" alternative: food and kindred products (I-O 14), apparel (I-O 18), and printing and publishing (I-O 26), and they account for only 11 percent of the total compensation generated. Although five commodity-producing industries appear on the list for the "education" alternative they account for only 8 percent of the total compensation generated.

The impact of the other two alternatives, "investment" and "multifamily dwellings," is mainly on the commodity-producing industries. New construction (I-O 11) is the most important in both. The other commodity-producing industries affected by the "multifamily dwellings" alternative are those directly and indirectly supplying the construction industry, e.g., stone and clay products (I-O 36), primary iron and steel products (I-O 37), lumber and wood products (I-O 20). Equipment-producing industries affected by the "investment" alternative are: motor vehicles (I-O 59), electric industrial equipment (I-O 53), and metal working machinery and equipment (I-O 47).

Three service-type industries appear rather prominently on all four lists: trade (I-O 69), transportation (I-O 65), and business services (I-O 73). The trade and transportation industries are associated with virtually all transactions involving the sale and movement of materials from producer to both intermediate and final consumers. Business services, which include advertising, are also important inputs to most producing industries. Therefore, these rather universally used services become widely diffused indirectly as well as directly as inputs associated with any pattern of final expenditures.

Table 4 indicates the industrial concentration of the employee compensation generated by the alternative expenditure patterns. Almost one-fourth of the effect of the "PCE" alternative is in trade (I-O 69), and 65 percent of the total effect occurs in the 10 top industries listed in table 4. The remaining 35 percent is spread among all other industries. The concentration for the "investment" alternative is similar,

## Industrial Composition of Employee Compensation Generated by Alternative Patterns of Final Demand

THIS section illustrates the use of input-output analysis and the value-added data presented in this article to examine the amount and the industrial distribution of employee compensation generated by different types of final expenditures. The technique can, of course, be used to examine impacts on the other components of value added as well.

The illustration considers four different \$1 billion increments to final demand, each of which could result fairly directly from policy decisions. The first alternative is \$1 billion of PCE—i.e., \$1 billion whose industrial composition is the same as that of PCE.<sup>9</sup> This might be thought of as, e.g., a change in spending resulting from changes in personal income taxes. The second alternative uses the industrial composition of gross private domestic investment, and could represent a change in spending resulting from a change in the investment tax credit.

The industrial composition of government purchases of goods and services for public education is used for the third alternative, and the fourth uses the composition of inputs required for the construction of multifamily housing.

Each expenditure alternative was applied to a special matrix of coefficients that measures for each industry the total employee compensation generated directly and indirectly in its supplying industries per dollar of the industry's output delivered to final demand.<sup>10</sup> The results are summarized in table 4, which shows the I-O industries most affected by each alternative. The total amount of compensation generated by \$1 billion of final demand varies from a low of \$469 million for the "PCE" alternative to a high of \$861 million for the "education" alternative.

The compensation generated by the "PCE" and "education" alternatives is mainly in the non-material producing

9. The four patterns of expenditures are meant to be illustrative. The average pattern in 1963 is used for each, although it is recognized that the industrial composition of incremental changes in a particular type of expenditure may differ from that of the category as a whole.

10. This is one of the four special coefficient matrices developed by BEA that are described in the technical note at the end of the article.

with 27 percent of the employee compensation occurring in the construction industry (I-O 11) and 63 percent of the total occurring in the leading 10 industries. In the "education" alternative, however, direct payments of wages and salaries by school systems account for

78 percent of the total impact and the 10 listed industries account for over 90 percent of the total. In the "multifamily dwellings" alternative, almost one-half of the impact is in the construction industry itself and the 10 top industries account for over 80 percent of the total.

in which pass-through assumptions can be modified are possible, the I-O approach to price analysis is essentially static. The assumptions underlying it are rigid and not always realistic in situations where dynamic factors are likely to be dominant—as is usually the case when there are real pressures on prices. The analysis does not allow for the effects of relative price changes on the quantity of goods purchased by producing industries (substitution) nor does it permit evaluating the "bandwagon" effect whereby a price increase in one industry stimulates price increases in other industries which are unrelated to cost considerations. However, the I-O approach does isolate one element in the complex set of factors which influence prices and may be useful in situations when the assumptions appear reasonable; e.g., a period of cost-push inflation.

## Use in Price Analysis

INPUT-OUTPUT analysis has been used to assess the potential impact of changes in the price of primary factors of production on the prices of other goods and services. For example, if changes in wage rates change the unit cost of labor in an industry, what is the likely effect on prices in the rest of the economy? Input-output analysis can trace the impacts on the prices of other goods and services if it is assumed that the increased factor cost is reflected in the price of the product of the industry where it occurs and that the increased cost to other users of the product is passed on exactly in the prices of their products. A simple example will illustrate how the effects of such a pass-through of increased factor cost would be calculated.

Assuming a 10 percent increase in unit labor costs in the iron and steel industry (I-O 37), what will be the impact on the price of motor vehicles (I-O 59)? If the iron and steel industry passes on 100 percent of the increased cost, the rise in price of iron and steel to its users would be 10 percent of .278, the ratio of compensation to output for the iron and steel industry as shown in column 4 of table 1. The amount of iron and steel that the motor vehicle industry requires directly and indirectly per dollar of its finished product is \$0.21208 (the coefficient from row 37, column 59 of table 3, the total requirements table, in the November 1969 SURVEY article). The calculation (.10 x .278 x \$0.21208) equals \$0.006 per \$1.00 of output, or an indicated rise of .6 percent in the factory price of motor vehicles.<sup>11</sup>

Similar calculations will show the

effects of the rise in iron and steel wage costs on the price of finished products of other industries, and the effects of changes in the cost of other components of value added. If changes also occur in the costs of primary inputs to other industries the resulting calculations can be accumulated to determine the total effect on the price of any product.

Although more elaborate price models

## Appendix: Reconciliation of Alternative Estimates of Industry Value Added:

### 1963 Gross Product Originating and Value Added

#### In the 1963 I-O Study

BEA prepares annual estimates of gross product originating (GPO) in each major industry. (Preliminary estimates for 1972 are on page 19 of this issue; revised estimates are published each July.) The estimates of value added for industries in the 1963 input-output study are based mainly on the GPO estimates for that year and conceptually agree in total. However, the data underlying the GPO estimates have been reallocated to match the industrial classification and the concepts and conventions used in the I-O study. In addition, some preliminary revisions to the GPO estimates, made in connection with work on the 1963 benchmark of the national accounts, have been incorporated into the I-O estimates of industry value added but not yet into

the GPO data. Table 5 reconciles the two sets of industry value-added estimates showing the amounts and main reasons for the differences at the industry detail for which the GPO estimates are published. This reconciliation should be helpful to anyone wishing to adapt the more current GPO data in modifying or updating the 1963 table for use in input-output applications.

The differences shown in column 2 of table 5 are due to differences in the industry classifications used in compiling the two sets of data. The GPO estimates adhere strictly to the Standard Industrial Classification (SIC). In the I-O system, however, some industries are reclassified in order to achieve industry groups that are more homogeneous and that thus have a more

11. The calculations can be made more directly with the special value-added coefficient matrices described in the technical note.

stable input structure. These reclassifications, identified in table 5 by SIC code, consist of shifting veterinary services from the agricultural sector to the services sector, oil and gas field drilling services from mining to construction, and trading stamp companies from services to wholesale and retail trade.

Columns 3 and 4 of table 5 give the differences between the GPO and the I-O value-added estimates that are due to the "redefinition" of certain activities (rather than whole SIC industries) from one industry to another. Column 3 shows the differences that are due to the fact that in the I-O system all construction and installation work performed by employees in establishments not in the construction industry (i.e., force account construction) is redefined to be in the construction industry. Column 4 shows the effects of all other redefinitions: manufacturing and service activities that occur in the trade and transportation industries are shifted to the appropriate manufacturing and service industries; trade activities occurring in other industries are shifted

to wholesale and retail trade; and manufacturers' sales offices are shifted from wholesale trade to manufacturing. The details underlying the figures in column 4 are given in footnotes to the table.

In the calculation of the GPO estimates, the inventory valuation adjustment is distributed among the industries holding inventories. In the input-output table it appears as a separate industry (I-O 87). The resulting differences in value added by industrial sector are given in column 5.<sup>12</sup>

The remaining differences, shown in column 6, are essentially statistical. There are three main sources of these differences.

First, preliminary 1963 benchmark revisions to the national income and product (NIP) accounts have been incorporated into the I-O value added figures estimates but not into the GPO estimates. These preliminary revisions lowered total GNP slightly (\$114 mil-

12. The industrial distribution of IVA varies greatly from year to year. Therefore the pattern shown in column 5 should not be used as a model. Annual data on IVA in this detail are published in table 6.10 of the national income and product accounts.

lion) and changed the allocation among industries.

Second, the statistical discrepancy in the NIP accounts—the difference between the "income side" and the "product side" estimates of national output—is shown as a separate total in the GPO estimates. In the I-O tables, however, there is no statistical discrepancy, since the sum of value added by industry equals GNP.

Third, some estimates of value added for the input-output table are derived from different sources from those used in estimating GPO. For example, the 1963 I-O estimates of employee compensation in the detailed mining and manufacturing industries were based on data from the 1963 Censuses of Manufactures and Mineral Industries, whereas State unemployment insurance records were used for the GPO estimates. Also, estimates of property-type income for some of the I-O industries were derived from the reports of regulatory agencies, whereas Internal Revenue Service data were used in estimating GPO.

Table 5.—Reconciliation of Estimates of Industry Value Added, 1963

(Millions of dollars)

**Technical Note**

---

A. The methods used to allocate value added and its components in mining and manufacturing may have resulted in errors that have a cumulative effect on property-type income of the industries in these sectors. Value added for industries in mining and manufacturing was calculated by subtracting estimates of purchased business services (developed in the I-O analysis of intermediate inputs) from Bureau of the Census data on "value added by manufacture." These industry estimates were adjusted to the control total for value added in the major industry divisions and then adjusted to reflect the reclassifications and redefinitions used in the I-O study. The next step involved the allocation of employee compensation and indirect business taxes among the mining and manufacturing industries. Employee compensation estimates were based on Census data on establishment payrolls, adjusted to include wage supplements and to reflect redefinitions and reclassifications. The allocation of indirect business taxes to mining and manufacturing industries was based on several sets of allocators, depending on the type of tax or nontax payment, and also adjusted for redefinitions and reclassifications. Property-type income for an industry was estimated as a residual and was, therefore, subject to errors in estimating total value added or either of the other components.

B. The ratios of value added to total output (columns 10 through 13 of table 1) are intended for use with the published input-output tables and the reader is cautioned against applying them to other sets of data relating to production or output without taking account of the special conventions used in the I-O table which affect the ratios. The main conventions and definitions affecting the I-O data on output and value added are as follows:

(1) Imputations have been included in the I-O measures of output which are not reflected in the ordinary statistics on output in dollar terms. The main imputations occur in agriculture, for the value of nonpurchased feed, seed, and fertilizer; in finance and insurance, for the imputed value of banking services; and in the rental and real estate industry, for the imputed rental value of owner-occupied houses.

(2) In most cases secondary production has been treated in the I-O system as if it were sold by the industry where it was made to the industry producing it as its primary activity. This is done

in order to supply a product to all users from a single source. Consequently, the output of such "transferred" secondary products is counted twice—once in the industry where it is made and again in the industry from which it is distributed.

(3) In other cases secondary activities have been "redefined" from the industry where they occur to the industry where they are primary. This means that both the output and corresponding inputs (intermediate and value added) have been shifted. If these redefinitions are sizeable, they can affect the value-added ratios of the industries involved. In the case of force account maintenance and repair construction, the value added and intermediate inputs which have been redefined out of an industry are replaced by an intermediate purchase of repair and maintenance services, thus reducing the ratio of value added to output.

(4) Imports of goods and services which are the same as those produced domestically and which are used in further production (transferred imports) are added to the total output of the industry producing the domestic counterpart. If such imports are a significant part of the total supply they affect the value-added ratio.

(5) The output of wholesale and retail trade is defined as gross margins and excludes the value of goods purchased for resale.

(6) Excise taxes are added to Census value of shipments and to value added. Similarly, general and special sales taxes are added to the output and value added of the industries which collect and remit them. Customs duties are part of the output and value added of wholesale trade.

C. In describing the derivation of table 2, "Primary Inputs Per Dollar of Industry Sales to Final Demand," the column of coefficients from the total requirements table (table 3 in the November 1969 article) was described as a set of weights which when applied to the appropriate value-added-to-output ratios will make the column sum to 1.0. However, because of the treatment of scrap and byproducts in the input-output tables, this is not true in all cases. In analyzing the demand for industry output, it is desirable to avoid the anomalous situation in which the demand for scrap and byproducts would generate output in the industry which yields them. Therefore, the direct requirements coefficients (table 2 in the November 1969 article) were adjusted to interrupt the flow

of these products before the calculation of the total requirements table (table 3 in the 1969 article). The net effect of these scrap and byproduct adjustments on the direct requirements coefficients, which were then used to derive the total requirements table, results in a residual value-added coefficient which is slightly different from the one which is published. Consequently, the value-added calculations using the published total requirements coefficients and the published value-added coefficients will not sum to precisely 1.0 in all cases. Adjustments have been made in the weights used to combine the value-added-to-output ratios in order to eliminate the effects of this treatment of scrap and byproducts in the industries where it has a significant impact so that the value added and import content of each final product would add to 1.0.

D. BEA has created four sets of special value-added coefficients that can be used to calculate in one step the industry distribution of the value added generated directly and indirectly by an industry's sale to final demand. The four sets are:

- Total value added
- Employee compensation
- Indirect business taxes
- Property-type income

The set of special value-added coefficients was calculated by multiplying the rows of the total requirements table (table 3 in the 1969 article) by the ratio of value added to total output for the appropriate producing industries. To derive the set of special coefficients for each of the components of value added, the process was repeated, using the ratio to total output for the appropriate value-added component.

The four sets of special value-added coefficients are available on one magnetic tape and can be ordered for \$200. Request should be addressed to the Interindustry Economics Division, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, D.C. 20230. A check payable to "SESA, Department of Commerce" for the total amount must be enclosed with the order. The tapes are generated on a Honeywell 1250. The data are inscribed as 7 track, 556 BPI, and are available in either even or odd parity. A detailed description of the tape layout is included with each data tape. Please specify parity desired when ordering tape.

# CURRENT BUSINESS STATISTICS

**T**HE STATISTICS here update series published in the 1971 edition of BUSINESS STATISTICS, biennial statistical supplement to the SURVEY OF CURRENT BUSINESS. That volume (available from the Superintendent of Documents for \$3.00) provides a description of each series, references to sources of earlier figures, and historical data as follows: For all series, monthly or quarterly, 1967 through 1970 (1960-70 for major quarterly series), annually, 1947-70; for selected series, monthly or quarterly, 1947-70 (where available). Series added or significantly revised after the 1971 BUSINESS STATISTICS went to press are indicated by an asterisk (\*) and a dagger (†), respectively; certain revisions for 1970 issued too late for inclusion in the 1971 volume appear in the monthly SURVEY beginning with the September 1971 issue. Also, unless otherwise noted, revised monthly data for periods not shown herein corresponding to revised annual data are available upon request.

The sources of the data are given in the 1971 edition of BUSINESS STATISTICS; they appear in the main descriptive note for each series, and are also listed alphabetically on pages 189-90. Statistics originating in Government agencies are not copyrighted and may be reprinted freely. Data from private sources are provided through the courtesy of the compilers, and are subject to their copyrights.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1970	1971	1972	1970				1971				1972				1973

† Revised. ‡ Preliminary. § See note "§", this page. ¶ Beginning Dec. 1971, data on new basis reflect inclusion of paper issued directly by real estate investment trusts and several additional finance companies. § Insured unemployment (all programs) data include claims filed under extended duration provisions of regular State laws; amounts paid under these programs are not included in the annual figures. † Revised (back to 1951) to reflect new seasonals and other modifications. ‡ Insured unemployment as % of average covered employment in a 12-month period.

⊙ Series revised to reflect recalculation of seasonal factors and trading-day adjustment; revisions back to 1964 are shown in the July 1972 Federal Reserve Bulletin, p. 634. † See note "†", p. S-13. ‡ Total SMSA's include some cities and counties not designated as SMSA's. § Includes Boston, Philadelphia, Chicago, Detroit, San Francisco-Oakland and Los Angeles-Long Beach. ¶ Includes data not shown separately.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1971	1972	1972										1973

<sup>†</sup> Revised. <sup>‡</sup> Preliminary.  
<sup>1</sup> Average for Dec. <sup>2</sup> Average for year. <sup>3</sup> Daily average. <sup>4</sup> See note "Ⓢ" for this page. <sup>5</sup> Beginning Jan. 1973, data reflect changes in sample and weighting. <sup>Ⓢ</sup> Beginning Nov. 1972, data are not comparable with those for earlier periods because of regulatory changes affecting reserve requirements (Regulation D) and check collection processing (Regulation J) that became effective in early November.  
<sup>Ⓢ</sup> For demand deposits, the term "adjusted" denotes demand deposits other than domestic commercial bank and U.S. Government, less cash items in process of collection; for loans, exclusive of loans to and Federal funds transactions with domestic commercial banks and after deduction of valuation reserves (individual loan items are shown gross; i.e

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1971	1972	1972										1973

† Revised. ‡ Preliminary. § Beginning Jan. 1972 valued \$38 per fine ounce. ¶ Or increase in earmarked gold (-). ♂ Effective February 1973 SURVEY, data revised to reflect: Annual review of seasonal factors; regular benchmark adjustment; effect of changes in check collection procedures (Regulation J); and adjustments to include new figures from internationally oriented banking institutions. Monthly revisions back to 1959 will be shown later.

† At all commercial banks. ‡ Series revised to reflect recalculation of seasonal factors; revisions back to 1964 are shown in the July 1972 Federal Reserve Bulletin, p. 634. © Total SMSA's include some cities and counties not designated as SMSA's. ♂ Includes Boston, Philadelphia, Chicago, Detroit, San Francisco-Oakland, and Los Angeles-Long Beach.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1971	1972	1972										1973

\* Revised.  $\phi$  Preliminary.  $\phi$  End of year. \*New series; more detailed information appears in the February 1972 Federal Reserve Bulletin.

$\phi$  Includes data not shown separately.  $\phi$  Beginning April 1971 SURVEY, data restated to include "other transportation" in addition to railroad data formerly shown.

$\phi$  Number of bonds represented fluctuates; the change in the number does not affect the continuity of the series.

$\phi$  Prices are derived from average yields on basis of an assumed 3 percent 20-year bond.

$\phi$  For bonds due or callable in 10 years or more.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1971	1972	1972												1973

<sup>1</sup> Revised. <sup>2</sup> Preliminary. <sup>3</sup> Annual total reflects revisions not distributed to monthly or quarterly data.

<sup>4</sup> Includes data not shown separately.

<sup>5</sup> Applies to passengers, baggage, cargo, and mail carried.

<sup>6</sup> Passenger-miles as a percent of available seat-miles in revenue service; reflects proportion of seating capacity actually sold and utilized. <sup>7</sup> Total revenues, expenses, and income for all groups of carriers also reflect nonscheduled service.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1971	1972	1972												1973

<sup>†</sup> Revised. <sup>‡</sup> Preliminary. <sup>§</sup> Corrected.  
<sup>1</sup> Reported annual total reflecting revisions not distributed to the monthly data. <sup>2</sup> Series discontinued. <sup>3</sup> Less than 500 short tons. <sup>4</sup> Annual total reflects sulfur content, whereas monthly data are gross weight. <sup>5</sup> Gross weight. <sup>¶</sup> Beginning Jan. 1972, data exclude polyvinyl acetate, polyvinyl alcohol, and other vinyl resins.  
<sup>⊕</sup> Except for glycerin, scattered revisions have been made in the annual data back to 1965; monthly revisions are not available.  
<sup>⊗</sup> Data are reported on the basis of 100 percent content of the specified material unless otherwise indicated. <sup>⊘</sup> Includes data not shown separately.  
<sup>§</sup> Data exclude black blasting powder.  
<sup>†</sup> Revised monthly data for 1970 will be shown later.

† Revised. † Reported annual total; revisions are not distributed to the monthly data.  
 ‡ Includes Hawaii; no monthly data available.  
 § Data are not wholly comparable on a year to year basis because of changes from one

classification to another. † Data restated to represent the total gas utility industry, 99 percent of which is natural gas; also, sales are expressed in B.t.u. instead of therms.  
 ‡ Revised data for months prior to May 1971 will be shown later.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1971	1972	1972												1973

† Revised. † Reported annual total; revisions not allocated to the months or quarter.  
 ‡ Data cover 5 weeks; other months, 4 weeks. § Crop for the year 1971. ¶ Crop for the year 1972.  
 \* Data for total board products are available back to 1947. † Monthly revisions (1968-71), reflecting recent benchmark adjustments, appear in "Woven Fabrics: Production, Stocks, and Unfilled Orders," M22A—Supplement (Dec. 1972), Bureau of the Census.  
 ‡ Includes data not shown separately.

§ Stocks (owned by weaving mills and billed and held for others) exclude bedsheets, toweling, and blanketing, and billed and held stocks of denims.  
 ¶ Unfilled orders cover wool apparel (including polyester-wool) finished fabrics; production and stocks exclude figures for such finished fabrics. Orders also exclude bedsheets, toweling, and blanketing.  
 † Total ginnings to end of month indicated, except as noted.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1971	1972	1972										1973

\* Revised. <sup>1</sup> Season average. <sup>2</sup> For 5 weeks; other months, 4 weeks. <sup>3</sup> Less than 500 bales. <sup>4</sup> Price not directly comparable with earlier data. <sup>5</sup> Revised total; revisions not distributed by months. <sup>6</sup> Beginning Aug. 1971, net weight basis; 1971 average is for Aug.-Dec. <sup>7</sup> Avg. for Oct.-Dec. <sup>8</sup> Avg. for Nov.-Dec. <sup>9</sup> Beginning Aug. 1971, prices are on 480-lb. net-weight bale basis (for earlier months, on 500-lb. gross-weight bale basis); to

compute comparable prices for earlier months, multiply farm price by 1.04167 and market price by 1.0438. <sup>†</sup> Effective with the Oct. 1972 SURVEY, series restated on an unadjusted basis.

♀ Includes data not shown separately.

♂ Effective Nov. 1972, specifications were changed: Print cloth, to 64x56; sheeting, to 47x44.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1971	1972	1972										1973

† Revised. † Annual total includes revisions not distributed by months. † Estimate of production, not factory sales. † Omits data for three States. † Omits data for two States. † Omits data for 4 States. † Effective Feb. 1972, imports include trucks valued less than \$1,000 each.

SECTIONS

General:

Business indicators..... 1-7  
 Commodity prices..... 7-9  
 Construction and real estate..... 9, 10  
 Domestic trade..... 11, 12  
 Labor force, employment, and earnings..... 13-16  
 Finance..... 16-21  
 Foreign trade of the United States..... 21-23  
 Transportation and communications..... 23, 24

Industry:

Chemicals and allied products..... 24, 25  
 Electric power and gas..... 25, 26  
 Food and kindred products; tobacco..... 26-30  
 Leather and products..... 30  
 Lumber and products..... 31  
 Metals and manufactures..... 31-34  
 Petroleum, coal, and products..... 34-36  
 Pulp, paper, and paper products..... 36, 37  
 Rubber and rubber products..... 37  
 Stone, clay, and glass products..... 38  
 Textile products..... 38-40  
 Transportation equipment..... 40

INDIVIDUAL SERIES

Advertising..... 11, 16  
 Aerospace vehicles..... 4, 40  
 Agricultural loans..... 16  
 Air carrier operations..... 23  
 Air conditioners (room)..... 34  
 Aircraft and parts..... 6, 7, 40  
 Alcohol, denatured and ethyl..... 25  
 Alcoholic beverages..... 11, 26
